Re: **Geotechnical Engineering Evaluation**
US Route 301 Southbound
Replacement Bridge over Four Hole Swamp
Orangeburg County, South Carolina
GSE Project No. 41503-0002-0001

Dear Ms. Sara Stone:

GeoStellar Engineering, LLC (GSE) has completed a geotechnical engineering evaluation for the US 301 southbound replacement bridge over Four Hole Swamp. This work was prepared in general accordance with the Scope of Services and discussions between GeoStellar Engineering, LLC and SCDOT as indicated in the notice to proceed (NTP) dated June 19, 2015. This evaluation presents preliminary subsurface site characterization, bridge foundation recommendations, and bridge approach embankment stability evaluation that can be used for the design of the southbound bridge replacement structure over Four Hole Swamp. This evaluation has been prepared in general accordance with the South Carolina Department of Transportation (SCDOT) Geotechnical Design Manual (GDM; Version 1.1, 2010).

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this evaluation, or if we may be of further service, please contact us.

GEOTECHNICAL ENGINEERING EVALUATION
US 301 Replacement Bridge over Four Hole Swamp
Orangeburg County, South Carolina

March 16, 2016

1 BACKGROUND

GeoStellar Engineering, LLC (GSE) has been retained by SCDOT to provide geotechnical engineering evaluations for this project by performing a review of the subsurface soil exploration, a liquefaction assessment, a review of the bridge interior bent foundations, and a review of embankment longitudinal slope stability. These evaluations were performed after our review of the following documents provided by SCDOT:

1. Preliminary Bridge plans dated January 26, 2015
2. Bridge foundation plan layout (existing and proposed) dated June 10, 2015
3. Bridge Load Data Sheet dated April 2, 2015.
4. Bridge Plan and Profile Layout dated June 10, 2015. Plan sheet indicates all subsurface investigation locations (ICA and PSI) and scour profiles.
5. Roadway cross-sections dated June 9, 2015.
6. ICA Revised Geotechnical Data Report dated October 17, 2014.
7. PSI Geotechnical Subsurface Data Report dated February 27, 2015.
8. SCDOT Preliminary Bridge Geotechnical Engineering Report dated October 15, 2014.

Discussions and meetings between GSE and SCDOT revealed that SCDOT has identified weak subsurface soil conditions (i.e. WOH or very low SPT blow counts) that are possibly susceptible to soil shear strength loss (SSL) under the Extreme Event I limit state within the subsurface alluvium soils and underlying the base of the Santee Formation within the Congaree Formation. The subsurface weak soils were first encountered by ICA in their initial geotechnical subsurface data report. An additional subsurface investigation was conducted by PSI to supplement the initial ICA geotechnical subsurface data report. SCDOT has concerns that the weak soils encountered within the Congaree Formation will have detrimental effects on the constructability and costs of the proposed drilled shaft foundations located at the internal bridge bents. SCDOT also has concerns that the weak alluvium soils may adversely affect the performance of the bridge approach embankments during the Extreme Event I limit state that may require ground improvement.

On April 13, 2015 SCDOT consulted with the William R. Doar III, Senior Geologist – Coastal Plain, of the South Carolina Geological Survey in order to gain a better understanding of the geology at the project site. Of special interest was the geology below the Santee Limestone Formation where weak soils had been encountered. The underlying formation was classified as the Congaree Formation in the subsurface geotechnical data reports. Mr. Doar has indicated that this formation may actually be the Warley Hill Formation. In follow up discussions by GSE with Mr. Doar it was concluded that these weak soil zones are most likely not the result of sinkhole found in karst terrain that is typically underlain by limestone and are more likely to be the result of scour holes cause by wave action that were filled with weak soils and then overlain by the Santee Limestone Formation.

2 GENERAL PROJECT INFORMATION

2.1 Project Description

This project consists of the replacement the US 301 southbound bridge over Four Hole Swamp in Orangeburg County, South Carolina. The bridge is located at approximately Latitude 33.457508° and Longitude 80.647784° on US 301 between Orangeburg and Santee. The bridge location is shown on the site location map in Figure 1.

2.2 Project Information and Site Details

The new bridge is a 294 feet long with a 264 feet long continuous flat slab bridge deck consisting of six 44 feet long spans between Bents 1 and 7 and one 30 foot flat slab between Bents 7 and 8. The bridge span arrangement is the same as the northbound bridge crossing Four Hole Swamp in order to maintain the same current bridge hydraulics at both structures. At this time only the southbound bridge is being replaced along the same alignment of the existing bridge. The roadway cross-sections indicate that the finished grade is being raised by approximately two feet above the existing bridge abutments embankments currently at about elevation 120 feet. There are no signs of bridge approach embankment settlement at the existing bridge abutments upon review of aerial photography. The existing bridges do not appear to have any approach slabs.

The bridge hydraulic information included in the plans indicates a 50 year H.W. elevation of 118.3 and a 100 year H.W. elevation of 119.0 feet. The bridge drawings also include bridge scour profiles for the 100 year scour and the 500 year scour as shown in Table 1.

Table 1. Bridge Scour Summary

Bridge Bent	Elevation (ft-msl)		
	Ground Surface	100-Year Scour	500-Year Scour
End Bent 1	119	119.0 (no scour)	119.0 (no scour)
2	114	99.0	99.0
3	114	87.5	82.7
4	114	96.6	94.4
5	114	96.0	93.8
6	114	84.4	81.4
7	114	103.0	103.0
End Bent 8	119	119.0 (no scour)	119.0 (no scour)

3 SUBSURFACE CONDITIONS

3.1 Local Site Conditions

The project site is located within the USDA MLRA Atlantic Coast Flatwoods region (153A) of the Coastal Plain Province of the Atlantic Plain. This area is relatively flat coastal plain that is crossed by many broad, shallow valleys that have widely meandering stream channels. The new bridge will cross over Four Hole Swamp that is a small blackwater river that is a tributary to the Edisto River. The surface soils at this site are within a flood plain with a natural ground surface elevation of approximately 110 ft-msl. The surface

soils are poorly drained and are from the USDA Mouzon Series and are classified as Mouzon fine sandy loam (Mo).

3.2 Area Geology

The project site is located in the Middle Coastal Plain Province between the South Carolina geologic features referred to as the Orangeburg Scarp (OS) and the Surry Scarp (SS). The approximate location of the project is shown on the Generalized Geological Map of South Carolina in Figure 2. The surface topography of this region is marked by abandoned shorelines that form marine terraces. The project site is located within the Marietta Unit (previously Okefenokee terrace) that is typically encountered between the Surry Scarp at elevation 90 feet and the Parlor Scarp 140 ft-msl. Based on the Generalized Geological Map, the surface geology consists of the Marietta Unit formation of Pleistocene epoch underlain by the Santee Limestone formation.

The soils underlying the Marietta Unit terrace were formed during the Eocene epoch. The general geology at the project site has been simplified into the following four major soil formations (in order encountered, from the surface downward):

1. *Marietta Unit (previously Okefenokee/Sunderland) Terrace Sediments* – The soils underlying the Marietta Unit terrace were formed during the Pleistocene epoch and are generally described as quartz sand to granules or pebbles, Quartz-pebble conglomerate, mixed Quartzose sand and clay, and minor clay.
2. *Santee Limestone* – This formation was formed during the middle of the Eocene epoch and is typically considered part of the Orangeburg Group. The formation consists of fossiliferous limestone with sand, marl, and shell beds. The top of the Santee Limestone in this area is typically located near surface underlying surficial terrace sediments.
3. *Warley Hill Formation* – This Warley Hill formation was formed within the middle Eocene epoch and is typically considered part of the Orangeburg Group. The formation consists of fine green to yellow glauconitic sand.
4. *Congaree Formation* – The Congaree formation was formed within the late Eocene epoch and is typically considered part of the Orangeburg Group. The formation consists of light gray to green shale alternating with thin bedded fine grained siltstone. Glauconitic sand and interstitial clay.

3.3 Soils Encountered and Groundwater

Geotechnical subsurface site investigations were performed by Infrastructure Corporation of America Engineering (ICA) and Professional Service Industries, Inc. (PSI) as shown in Table 2. ICA performed 16 soil test borings (STB), 4 hand augers (HA), 2 bulk samples (BS), and a multichannel analysis of surface waves (MASW) for the preliminary subsurface site investigation. PSI performed 7 STBs and 2 dilatometer test soundings (DMT).

[1] Elevations referenced to Mean Sea Level (MSL).

Groundwater measurements were obtained at least 24 hours after completion of drilling as summarized in Table 2. The ground water table elevations ranged from 105.5 ft-msl to 113.9 ft-msl. For evaluation purposes, a ground water table elevation of 110 ft-msl was used.

3.4 Laboratory Test Results

See Appendix A for index properties laboratory testing results. A summary of the laboratory soil shear strength testing results are provided in Table 3.

Table 3. Soil Shear Strength Laboratory Test Results

Company	Sample	Test Type	Location	Total		Effective	
				ϕ' (°)	c (psf)	ϕ' (°)	c (psf)
ICA	Bulk Sample 1	Direct Shear	B-1: 0-5ft depth	---	---	35.96	119.52
ICA	Bulk Sample 2	Direct Shear	B-8: 0-5ft depth	---	---	30.62	46.08
PSI	ST (UD)	Triaxial Shear CU w/PP	RW-3B[1]: 9-11 ft depth	23.8	76	28.9	324

[1] PSI Triaxial test was performed on sample from RW-3A, not from B-3A as indicated in laboratory test results (communication with SCDOT 1/20/2016).

3.5 Evaluation of Subsurface Soils

Laboratory index testing and visual soil classifications were used to evaluate the soil behavior of the subsurface soils encountered in all of the soil borings. The criteria in the 2010 SCDOT GDM Section 13.6 was used to determine soil behavior as either sand-like or clay-like.

The laboratory index testing from both subsurface investigations were used to plot the fines content (FC), plasticity index (PI), and natural moisture content (NMC) vs. elevation as shown in Figure 4. The general trend observed for each of the formation are shown in Table 4.

Table 4. Project Site Soil Behavior Trends

Formation	Approximate Elevation (ft-msl)		Soil Behavior	USCS Soil Type
	Bottom	Top		
Recent (Fill Embankment)	110	120	Sand-Like	SM, SW-SM, SP
			Clay-Like	SC
Marietta Unit	100	110	Sand-Like	SP, SM, ML, SM
			Clay-Like	SC, SC-SM, CL
Santee Limestone	30	100	Sand-Like	ML, SC (SC-SM)
			Clay-Like	ML, SM
Warley Hill	10	30	Sand-Like	SW-SM, SP-SM, SC-SM (SW)
			Clay-Like	MH, SM
Congaree	---	10	Sand-Like	SM, SW-SM
			Clay-Like	MH, CL (CH)

The trends observed in Table 4 were used to interpret subsurface soil behavior for soils that did not have any index testing performed. The interpretation of Sand-Like /Clay-Like for all soil samples is presented by plotting the fines content (FC), plasticity index (PI), and natural moisture content (NMC) vs. elevation as shown in Figure 5.

The interpreted results were then applied to all borings and used to develop a Subsurface Soil Profile of Sand-Like and Clay-Like soils shown in Figures 6 through 9.

The geotechnical subsurface profile and field and laboratory testing revealed in the Marietta Unit formation zones of weak clay-like soils (i.e. ML, SM, SC, SC-SM, CL). Weak clay-like soils subject to cyclic softening were predominantly encountered in ICA soil test borings (RW-1, RW-3, B-8, B-9, RW-5, RW-6, and RW-7) at or just below the water table. Isolated locations of sand-like soils subject to cyclic liquefaction were encountered in ICA soil test borings at RW-2 and at B-8 at or below the water table.

Since the groundwater table was found within 5 to 10 feet below the ground surface, SPT blow counts may reflect field exploration difficulties in preventing disturbance of these soils due to unbalanced hydraulic forces while drilling near the surface. The soil test boring B-8 boring log includes a note related to drilling method difficulties near the groundwater table, "Could not obtain sample at 15.0' due to bore backfilling w/wash rotary, switched to mud rotary drilling." PSI boring B-1A, B-3A, B-5A, B-6A, and B-7A showed weak soils only at the mudline, which is reasonable because these are within the channel of Four Hole Swamp subjected to scour.

It is our understanding that PSI borings were performed adjacent to ICA borings for confirmation purposes of soil classification and soil shear strength. In several instances there is significant contrast as presented below:

1. RW-3B (PSI) was taken to confirm the soil boring results obtained from RW-3 (ICA). RW-3 indicated SPT N_{60} = 1 bl/ft at 11.5 feet, at approximately the same depth RW-3B indicated SPT N_{60} = 3 – 5 bl/ft. PSI Triaxial test was performed on sample from RW-3A, not from B-3A as indicated in laboratory test results (communication with SCDOT 1/20/2016). PSI obtained an undisturbed soil sample at RW-3A and conducted a CU with Pore Pressure Triaxial test at the same depth and test results indicate: c=75psf, ϕ=23.8° and c'=325psf, ϕ'=28.9°, these results indicate that the ICA SPT N_{60} = 1bl/ft is significantly underestimating the shear strength of the clay-like soils in the Marietta Unit.

2. B-3A (PSI) was taken to confirm the soil boring results obtained from B-3 (ICA). B-3 indicated SPT N_{60} = WOH and B-3A indicated SPT N_{60} = WOH to 4 bl/ft within the Warley Hill formation from elevation 31 – 51 ft-msl. These SPT N_{60} generally are in the same range. The soil classification of these soils is significantly different, B-3A (PSI) classifies MH and SM clay-like soil and B-3 (ICA) classifies as a SW, sand-like soil. B-3 (ICA) relies on visual classification, whereas B-3A (PSI) included index testing. The significance of the soil classification is that B-3 (ICA) indicates potential for cyclic liquefaction of sand-like soil (soil shear strength loss) and seismic settlement and B-3A (PSI) indicates potential for cyclic softening of clay-like soils (no seismic settlement).

3. B-5A (PSI) was taken to confirm the soil boring results obtained from B-5 (ICA). B-5 indicated SPT N_{60} = WOH to 3 bl/ft and B-5A indicated SPT N_{60} = 46 – 50 bl/ft within the Warley Hill formation from elevation 32 – 42 ft-msl. These SPT N_{60} for B-5A (PSI) are significantly greater the B-5 (ICA). The soil classification of these soils is significantly different, B-5A (PSI) classifies ML clay-like soil and B-5 (ICA) classifies as a SW, sand like soil. The significance of the soil classification is that B-5 (ICA) indicates potential for cyclic liquefaction of sand like soil (soil shear strength loss) and seismic

settlement and B-5A (PSI) does not indicate potential for soil shear strength loss (SSL) or seismic settlement.

4. B-7A (PSI) was taken adjacent to B-7 (ICA) to evaluate the potential for weak soils within the Warley Hill formation since B-7 did not penetrate into the Wareley Hill Formation to evaluate the potential for weak soils. B-7A (PSI) indicated SPT N_{60} = 8 - 9 bl/ft from elevations 32 – 38 ft-msl. Borings B-8 (ICA) and B-9 (ICA) were taken approximately 30 feet east of B-7A (PSI) at Bent 8. Borings B-8 (ICA) indicates SPT $N_{60} \geq 50$ bl/ft and B-9 SPT N_{60} = 9 bl/ft from elevations 30 – 40 ft-msl. These SPT N_{60} for B-7A (PSI) are less than B-8 (ICA) and approximately the same as B-9 (ICA). The soil classification for borings B-7A (PSI), B-8 (ICA), and B-9 (ICA) is SP-SM, sand-like soils. The significance of the soil classification and SPT N_{60} is that B-7A (PSI) and B-9 (ICA) have the potential for cyclic liquefaction of sand like soil and seismic soil settlement. Boring B-8 (ICA) does not indicate potential for soil shear strength loss (SSL) or seismic settlement.

3.6 Subsurface Investigation Observations

Subsurface exploration observations are summarized below:

1. The weak soils in the Marietta Unit are typically clay-like soils and thus cannot be accurately modeled using SPT driving resistance. The weak clay-like soils should be modeled by using the laboratory shear strength test. The sand-like soils in the Marietta Unit that may have the potential for cyclic liquefaction were only encountered at isolated locations and may not be representative of the actual soil conditions.

2. Low blow count sand-like soils encountered at or below the water table in the upper 25 feet of borings B-8 and B-9 should not be considered representative since the low blow counts may reflect field exploration difficulties in preventing disturbance of these soils due to unbalanced hydraulic forces. The soil test boring B-8 boring log includes a note related to drilling method difficulties near the groundwater table, “Could not obtain sample at 15.0’ due to bore backfilling w/wash rotary, switched to mud rotary drilling.”

3. The soils encountered in the Warley Hill formation show distinct inconsistencies at Bent 3 (B-3/B-3A) and at Bent 5 (B-3/B-5A) with respect to soil classification and strength and this may indicate that the Warley Hill formation contains isolated pockets (not a uniform layer) of low strength soils that may be subject to cyclic liquefaction or cyclic softening.

4 SEISMIC EVALUATION

4.1 Seismic Response

The bridge design seismic parameters (i.e. PGA, S_{DS}, S_{D1}, etc.) shown in Table 5 were obtained from the SCDOT Preliminary Bridge Geotechnical Engineering Report dated October 15, 2014.

Table 5. Design ADRS Parameters

Design Earthquake	PGA (g)	S_{DS} (g)	S_{D1} (g)	M_w	R (km)	Site Class
FEE	0.20	0.39	0.18	7.36	64.1	D
SEE	0.43	0.87	0.49	7.37	63.3	D

4.2 Seismic Hazard

Soil Shear Strength Loss (SSL) and seismic settlements were evaluated using the procedures outlined by Idriss and Boulanger in the 2008 EERI Monograph MNO-12, "Soil Liquefaction During Earthquakes" and *Chapter 13 –* "*Geotechnical Seismic Hazards*" of the 2010 Geotechnical Design Manual (GDM). The results of the soil SSL analyses are summarized in *Section 4 – Soil Shear Strength Loss* of this report. The results of the soil SSL evaluation (screening and triggering) and seismic settlement are included in Table 6. The results of the seismic settlement analysis are summarized in Table 7.

4.2.1 Soil Shear Strength Loss

The potential for seismic soil shear strength loss (SSL) of the subsurface soils was evaluated by first screening the SPT soil borings to determine if the soils encountered are susceptible to soil shear strength loss (SSL). Soils identified as susceptible to soil SSL were then evaluated to determine if the seismic demand (SEE) was capable of triggering soil SSL. The soil SSL evaluation (screening and triggering) of borings RW-1, RW-2, RW-3, RW-4, RW-5, RW-6, RW-7, B-1, B-2, B-3, B-4, B-5, B-6, B-7, B-8, B-9, B-1A, B-3A, B-5A, B-6A, B-7A, and RW-3B are included in Appendix B and a summary of the SSL results is provided in Table 6.

A summary of the soil SSL triggering results with and without modification based on the observations in Section 3 – *Subsurface Soils Observations* is provided in Table 6.

Table 6. Soil Shear Strength Loss Triggering Summary

Boring No.	Geotech	SEE		SEE – Modified[1]

[1] Modified SSL results to reflect observations presented in *Section 3 – Subsurface Soils Observations*.

4.2.2 Seismic Settlement

The seismic settlement of soil susceptible to cyclic liquefaction was evaluated for borings RW-1, RW-2, RW-3, RW-4, RW-5, RW-6, RW-7, B-1, B-2, B-3, B-4, B-5, B-6, B-7, B-8, B-9, B-1A, B-3A, B-5A, B-6A, B-7A, and RW-3B. The total seismic settlement at the ground surface is summarized in Table 7 and in Appendix B.

Modified seismic settlements in Table 7 reflect the observations in Section 3 – *Subsurface Soils Observations* and reduction in ground surface damage according to Idriss and Boulanger 2008 Figure 107 (Ishihara 1985). A worst case boring B-3, with 20 feet of calculated seismic settlement, has approximately 50 feet of nonliquefied Santee Limestone Formation above the potentially liquefiable soils. According to Ishihara 1985, the case plots outside of the Liquefaction-induced ground damage curve for a max acceleration of 0.4g to 0.5g. Furthermore, as discussed in this report, the potentially liquefiable soils do not represent a continuous layer and rather appear as isolated pockets, further reducing the likelihood of ground surface distress resulting from soils below the Santee Limestone Formation.

[1] Possible erroneous data. Soil test boring B-8 boring logs includes a note related to drilling method difficulties near the groundwater table, “Could not obtain sample at 15.0’ due to bore backfilling w/wash rotary, switched to mud rotary drilling.”

5 SOIL SHEAR STRENGTHS

5.1 Embankment

Because the bridge approach embankments have been constructed and will only be raised approximately 2 feet, the soil shear strength obtained from laboratory soil shear strength testing conducted on the bulk samples should be representative of the existing and future embankment fill. A summary of the embankment soil shear strength parameters is shown in Table 8.

Table 8. Embankment Soil Shear Strength

Location	Effective	
	ϕ' (deg)	c' (psf)
East Bridge Approach Embankment at Bent 1	36	120
West Bridge Approach Embankment at Bent 8	31	50

5.2 In-Situ Soil Shear Strength

Soil shear strengths were computed based the soil behavior classifications of clay-like and sand-like defined in *Section 3 – Evaluation of Subsurface Soils* of this report. Static short-term soil shear strengths were computed using the SPT soil borings, DMT testing, and laboratory shear strength testing for the evaluation of the Strength and Service limit states. The corrected SPT blow counts (*Section 3 – Evaluation of Subsurface Soils*) were used to obtain total soil shear strength parameters based on correlations included in the 2010 SCDOT GDM, Sections 7.10 and 7.11, respectively. For sand-like soils an internal angle of friction was assigned based on correlations for sands. For clay-like soils a cohesion value was assigned based on correlations for clays. The computed SPT soil shear strength parameters (internal angle of friction or cohesion) and DMT shear strength parameters were combined and evaluated to characterize the total and effective soil shear strengths parameters in general accordance with Tables 7-15 and 7-16 of the SCDOT GDM unless laboratory testing was available.

Seismic soil shear strengths were computed using SPT soil borings for the evaluation of the Extreme Event I limit state. Soils that are not susceptible to soil shear strength loss were assigned the static short-term soil shear strengths. Soils that are susceptible to SSL were assigned seismic soil shear strengths based on the type of SSL triggering identified in Table 6. A summary of static soil shear strengths used for pile capacity analysis is provided in Table 9. A summary of static and seismic soil shear strengths used for slope stability analysis is provided in Table 10.

Table 9. Typical Soil Shear Strength Summary for Deep Foundation Design

[1] Soil Shear Strength Loss (SSL).

Static long-term soil shear strengths only affect clay-like soils after all excess pore water pressure has dissipated. The static long-term soil shear strength of clay-like soils is typically modeled using drained effective shear strength parameters (i.e. internal friction angle, ϕ'). The effective shear strengths of normally consolidated clay soils were computed using the correlations included in SCDOT GDM Section

7.11.2. A summary of the types of clay-like soils encountered with their corresponding long-term drained soil shear strengths is provided in Table 11.

Table 11. Typical Long Term Clay-Like Soil Shear Strength Summary

6 BRIDGE FOUNDATION ALTERNATIVES

SCDOT has requested GSE to evaluate foundation alternatives based on our review and evaluation of the of the geotechnical subsurface investigations prepared by ICA and PSI. It is our understanding that the original bridge design approach was to use H-Pile foundations at the bridge abutments and drilled shaft foundations at the interior bent locations.

6.1 Subsurface Soil Conditions Summary

Weak soils were encountered in the Warley Hill formation, located at the base of the Santee Limestone formation. The effects of these weak soils should be taken into consideration when selecting the bridge foundations. These weak soils encountered in the Warley Hill formation are referred to in this report as a “weak soil zone”. A summary of the weak soils encountered at the bridge borings is presented in Table 12.

Table 12. Warley Hill Formation Soil Shear Strength Loss Triggering Summary

[1] Modified SSL results to reflect observations presented in *Section 3 – Evaluation of Subsurface Soils*.

The subsurface conditions indicate that the Warley Hill formation weak soils subject to SSL will be encountered at Interior Bent 2 (5' of soil), Bent 3 (18'-20' of soil), Bent 5 (0 – 10' of soil), and Bent 7 (0 – 6' of soil). The weak soils encountered at the interior bents are relatively isolated at interior bents 2, 3, 5, and 7 and do not appear to delineate a consistent weak formation. Even though these soils may be subject to cyclic liquefaction, it is not anticipated that seismic settlement would translate into a uniformly settling of soils that would cause downdrag to a deep foundation. Conversely, because the weak soil zones are encountered at a depth of least 50 feet below the channel bottom, some risk does remain that additional areas may be subject to weak soil zones that may reduce the maximum allowable axial capacity of a deep foundation installed or of the bearing capacity of a shallow foundation. The following sections will provide the pros and cons associated with installing a drilled shaft, shallow spread footing, and driven pile foundation.

The extent and distribution of the weak soil zones is unknown. To further quantify the risk, at a minimum an expanded subsurface exploration would be required to locate the weak soil zones and define their extent. It is our understanding that because there is an existing foundation, time considerations, additional expense, and the risk remaining high that all weak soil zones cannot be quantified. Geophysical

testing was considered and discounted because of difficulties and unreliability in obtaining conclusive results for weak soils encountered 60 feet or more below the ground surface and having standing water within the area of interest.

6.2 Drilled Shafts

The selection of drilled shafts at the interior bents would be subject to challenges related to design and constructability. Drilled shafts are typically selected for interior bents in similar formations due to the requirement of large foundation capacity and relatively dense subsurface conditions typically encountered in the Santee Limestone and Congaree formations. Drilled shafts also provide large lateral resistance due to their size and stiffness that may be necessary when evaluating lateral loads where large scour depths are anticipated or when designing for Extreme Event I limit state. Drilled shaft construction is routinely performed by local contractors and SCDOT QA/QC procedures have been established and are routinely used.

The design and constructability of a drilled shaft becomes a challenge as a result of the weak soils encountered approximately 60 feet below the ground surface, within the Warley Hill formation. The challenge is even greater because the spatial distribution of the weak soils encountered is unpredictable. The drilled shaft construction approach significantly affects the design and consequently the cost of the foundation. The design and constructability concerns for a drilled shaft foundation are as follows:

1. For drill hole stability during construction of drilled shafts through the weak soils, the drilled shafts will require permanent casing to a depth of at least 85 feet below the dredge line (elevation 25 ft-msl). Total permanent casing to the order of 95 feet would be required at each drilled shaft.
2. The use of permanent casing to an elevation of 25 feet would require that the skin friction along the surface of the casing be ignored based on SCDOT standard practice. The drilled shafts will consequently get extremely long since the drilled shaft support length would begin at elevation 25 ft-msl.
3. Since the spatial distribution of the weak soils encountered is unknown, the design and construction approach would need to be applied to the entire bridge.

6.3 Shallow Foundations

Shallow spread footings are traditionally not used on bridge projects since this type of foundation typically requires subsurface soils with sufficient support within the depth of bearing influence that is in the range of 2 to 3 times the footing width. Shallow spread footings placed on rock or dense soil formations typically are feasible where there is low variability and where design conditions are not variable throughout the design life of the bridge such as in an overpass.

The design and constructability of a spread footing within a waterway and variable subsurface conditions becomes a challenge as a result of the scour requirements, weak soils encountered at elevation 50 ft-msl, foundation embedment requirements below the maximum scour elevation, and interference with existing structures. The challenge is even greater because the spatial distribution of the weak soils encountered is unpredictable. The constructability challenges will significantly affect the foundation costs. The design and constructability concerns for a shallow spread foundation at Bent 3 are presented below:

1. The scour at Bent 3 is approximately at an elevation of 82 feet which would require the bottom of the footing to be embedded to an approximate elevation of 72 ft-msl or installed at elevation 72 ft-msl with scour mitigation to protect the footing from being undermined. With water levels as high as an elevation of 119 feet, the Contractor would need to construct cofferdams to retain approximately 30 to 40 feet of soil within 37 to 47 feet of water.
2. There would be 22 to 32 feet of soil between the bottom of the spread footing and the top of the weak soils at elevation 50 ft-msl. This scenario would create a complex design in that the weak subsurface soils are encountered with in the depth of influence for the bearing support.
3. Since the spatial distribution of the weak soils encountered is unknown, the shallow spread foundation design would have a higher risk of failure or bad performance.
4. Construction time would need to be extended and seasonal changes may affect the construction changes.
5. Environmental permitting to construct cofferdams may be required.

6.4 Pipe Piles

The selection of pipe piles at the interior bents would be subject to challenges related to design and constructability. In order to replace the original design concept of drilled shaft foundations with driven piles, large pipe piles will need to be used in order to maintain high load capacity, foundation layout, and bridge hydraulics (i.e. scour). Steel pipe piles with thick walls can be driven through dense soils stratums. Steel pipe piles can be designed to resist large compressive driving stresses by specifying higher steel yield strengths, pipe sizes, and pipe wall thickness. Pipe piles can also be manufactured for different lengths and spliced in the field. Pipe piles are increasingly being used to support bridges and are routinely used in seismically active project sites in states such as Alaska and Montana. Recently, 30" and 72" diameters large pipe piles were chosen to be used for new bridges over Kentucky Lake and Lake Barkley.

The design and constructability of pipe piles becomes a challenge as a result of the weak soils encountered approximately 60 feet below the ground surface, within the Warley Hill formation. The challenge is even greater because the spatial distribution of the weak soils encountered is unpredictable. The pipe pile size, details, and specifications will significantly affect the design and consequently the cost of the foundation. The design and constructability concerns for a pipe pile foundation are as follows:

1. Special pipe pile structural connections are needed between the pipe pile and the pile cap. Several State DOTs such as Alaska and Montana are currently using specially designed connections. Alaska uses a special design to ensure that a plastic hinge occurs below the pile cap to avoid pile cap stresses that may damage the bridge during an earthquake.
2. Pipe piles typically need a concrete section constructed at the pile top to embed steel reinforcement and construct the connection to the pile cap. The minimum concrete section length should be designed and constructed inside the top of the pipe pile after the pipe pile has either been excavated to the minimum concrete section length or backfilled to the minimum concrete section length required. It is not common practice by other State DOTs or geotechnically necessary to auger out the soil plug to the pile tip and backfill with concrete. This practice may cause a loss in pile tip capacity by relieving the soil plug.
3. Large pipe piles are not a stock item and may need to be manufactured on a project-specific basis, therefore increasing cost and lead time. Because pipe piles are manufactured on a project-

specific basis, pile lengths, steel strength requirements, pipe thickness, and maximum number of splices can be specified in the plans.

4. Although it is preferable to splice piles when they are being manufactured, field splicing can be performed. The time required to accomplish this is based on the pipe pile size and thickness. Recent inquiries with the pipe pile manufacturers indicate that a 48-inch diameter pipe pile with 1.5" wall thickness could be field welded in 8 hours if only one welder is used and 4 hours if two welders are simultaneously being used with high quality welding equipment.
5. In order to avoid installation issues due to setup or delays, the Contractor should be required to drive full length piles. Splicing during pile installation should be avoided and limited to piles not achieving the required pile capacity after performing pile restrikes.
6. Guidance in the selection of pile driving equipment will need to be provided in the plans based on a driveability analysis. When driven piles need to penetrate through dense materials, the pile driving hammer will need to be monitored continuously during pile driving for hammer energy and rate of impact. The driving hammer will need to have reserve capacity to facilitate penetration through dense layers interbedded within moderate soils layers, mobilize pile capacity during pile restrikes, or in case the pipe pile becomes plugged. Typically a double-acting hydraulic hammer should be specified since the energy is adjustable by continuous variation of stroke and/or downward pressure resulting in a high efficiency of the energy transferred to the pile top. Typical hammer efficiencies of 95% are not uncommon. Higher speed double-acting hydraulic hammers are perceived to keep the pile in motion better by reducing inertia, skin friction and point resistance, thus facilitating the pile installation in dense granular soils.
7. Since the spatial distribution of the weak soils encountered is unknown, the design and construction approach would need to be applied to the entire bridge. It is recommended that a minimum pile length be specified that not only meets critical depth for lateral loads, Strength limit state axial loads, Extreme Event I limit state, and performance limits, but also achieves sufficient penetration to penetrate a minimum distance below the bottom of the deepest zone of weak soil.
8. Large pipe piles typically do not plug during continuous driving unless sufficient skin friction is developed inside the pile. It is also recognized that even if a static plug develops, the plugged pile tip bearing capacity may not be able to be verified using dynamic pile load testing. Static load testing has been shown to validate plugged pile tip bearing conditions. Consequently, to avoid costly static pile load testing, pipe piles should be designed as open-ended.
9. Dynamic testing should be conducted on index piles for pile capacity verification. An index pile should be located at each bent since there may be significant variability from bent to bent.

A limited literature research has been conducted with respect to the state-of-practice in the design of pipe piles.

7 BRIDGE FOUNDATION GEOTECHNICAL EVALUATION

Large pipe piles are recommended to support the bridge interior bent foundations.

7.1 Deep Foundation Type/Size and Foundation Loads

Discussions with SCDOT has indicated that a 48-inch pipe pile diameter would be the preferred foundation size based on their structural evaluation of the foundation sizes. SCDOT provided the axial compression and lateral pile loads for interior bents for the Strength and Service limit states as shown in Table 13. No load information was provided for the Extreme Event I limit state.

Table 13. SCDOT Foundation Loads[1]

Foundation Location			Strength Limit State			Service Limit State			Extreme Event I Limit State[2]
			Case 1FL ($P=P_{max}$)	Case 2FL ($V=V_{max}$)	Case 3FL ($M=M_{max}$)	Case 1SL ($P=P_{max}$)	Case 2SL ($V=V_{max}$)	Case 3SL ($M=M_{max}$)

[1] SCDOT provided axial compression loads and lateral loads on 8/26/2015.
[2] Not provided loads for Extreme Event Limit State.
[3] Only interior bents are considered in this evaluation.
[4] Lateral loads are applied at the top of the pile.

Pile top boundary conditions have been evaluated for both Fixed Head (Slope = 0) and Free Head (Moment = 0) conditions.

7.2 Strength Limit State Axial Compression Pile Capacity Analyses

Nominal (ultimate) axial compression pile capacities for the Strength limit state were computed using the computer software APILE 2014 (FHWA methodology). The ultimate pile capacity vs. depth for piles driven at Bent 3 have been plotted in Figure 12 and the results of the APILE analyses are included in Appendix C.

The determination of the Strength limit state required nominal pile capacity is shown in Table 14. The model used a 48-inch steel pipe pile with a wall thickness of 1.5 inches. Pipe wall thickness was determined from driveability analyses. Soil strength parameters were based on the soils recorded in STB B-3. The model included the 500-year scour by neglecting skin friction and toe bearing to a depth of 27 feet. Skin friction in the weak soil zone was neglected by modeling the soil with a friction angle of 0 degrees and an effective unit weight of 22 pcf (84.4pcf – 62.4 pcf). The unit skin friction was limited to 2 ksf for all soils. Nominal (Ultimate) pile capacities versus depth for Bent 3 are provided in Figure 12 with and without the weak soil zone.

The required pile driving resistance was determined using a model without scour, without any reduction in skin friction, and without the weak soil zone. A value was determined for both the plugged and unplugged pipe pile conditions. A resistance factor of 0.55 corresponds to Non-Redundant Strength Limit State Nominal Resistance Single Pile in Axial Compression with Dynamic Testing (PDA) and calibrated Wave Equation (SCDOT GDM Table 9-2). Two pile capacity evaluations were performed, one with the weak soil zone (Table 14) and one without the weak soil zone (Table 15).

Table 14. Strength Limit State Nominal Axial Compression Pile Capacity – weak soil zone encountered

Load Type	Strength Limit State
	Bent 3
Factored Axial Compression Load (kips)	768.4
Required Nominal Resistance (kips) Strength LS Resistance Factor φ = 0.55	**1398**
Estimated Pile Tip Penetration (feet)[1]	111
Estimated Pile Tip Elevation (ft-msl)	**-1**
Unplugged Required Pile Driving Resistance (kips)	**2851**
Plugged Required Pile Driving Resistance (kips)	**5728**

[1] Penetration referenced to ground elevation 110 ft-msl.

Table 15. Strength Limit State Nominal Axial Compression Pile Capacity – No weak soil zone encountered

Load Type	Strength Limit State
	Bent 3
Factored Axial Compression Load (kips)	768.4
Required Nominal Resistance (kips) Strength LS Resistance Factor φ = 0.55	**1398**
Estimated Pile Tip Penetration (feet)[1]	96
Estimated Pile Tip Elevation (ft-msl)	**14**
Unplugged Required Pile Driving Resistance (kips)	**2869**
Plugged Required Pile Driving Resistance (kips)	**5810**

[1] Penetration referenced to ground elevation 110 ft-msl.

Based on the subsurface investigation data, a minimum tip elevation of 10 ft-msl should be achieved to reach a sufficient depth below possible weak soils in the Warley Hill Formation and bear into the Congaree Formation.

7.3 Axial Pile Settlement

Axial compression loads on piles can produce vertical displacements as a result of pile-soil load transfer and elastic compression of the pile. The Strength limit state pile tip elevations (Table 14) were selected for Bent 3. The pipe pile was modeled with a 10-foot unsupported length above the ground surface. Pile top settlement for the service limit state is shown in Table 16.

Table 16. Service Limit State Pile Top Settlement

Pile Type	Settlement
	Bent 3
Service Axial Load (kips)[1]	552
Estimated Pile Tip Elevation (ft-msl)[2]	-1 / 14
Estimated Total Pile Length, TL (feet)[3]	121 / 108
Settlement Top of Pile (inches)	**< ⅛**

[1] Axial compression loads

7.4 Lateral Pile Response

The lateral response of the bridge pile foundations under combined axial and lateral loads has been evaluated for the Service limit state. The pile response was evaluated by performing soil-structure interaction analyses using the software program LPILE version 2013. The LPILE program solves a set of differential equations for a beam-column using a model of nonlinear lateral load-transfer p-y curves subjected to known boundary conditions. The structural section properties for the pipe pile are shown in Table 17. A friction angle of 24 degrees and an effective unit weight of 22 pcf (84.4pcf – 62.4 pcf) was selected for soil in the weak zone. The pipe pile was modeled with a 33-foot unsupported length above the scour depth for a scour elevation of 83 and with a 22-foot unsupported length above the scour depth for a scour elevation of 94, corresponding to a pile top at the bottom of the bent cap shown on the provided bridge plans.

Table 17. LPILE – Pile Input Properties

Pile Type	Area (in2)	Moment of Inertia (in^4)	Thickness of pile wall (inches)[1]	Modulus of Elasticity (ksi)
48” Steel Pipe Pile	219.13	59,287	1.5	29,000
[1] 1.5 inch thickness was used based on driveability analysis.				

The interior Bent 3 pile lateral response was evaluated with fixed head and free head conditions for the following soil and scour conditions:

- Weak Soil Zone Encountered, Scour Elevation at 83 feet (Scour at Bent 3)
- Weak Soil Zone Encountered, Scour Elevation at 94 feet (Scour at Bents 4 and 5)
- Weak Soil Zone Not Encountered, Scour Elevation at 83 feet (Scour at Bent 3)
- Weak Soil Zone Not Encountered, Scour Elevation at 94 feet (Scour at Bents 4 and 5)

The pile layout and spacing for the bridge bents are included in Figure 12. The interior Bent 3 LPILE results for a single pile are summarized in Table 18 through Table 25 for the Service limit state.

Weak Soil Zone Encountered, Scour elevation at 83 feet:

A summary of the range of Service limit state maximum lateral shear forces corresponding to displacements ranging from 1/8" to 1.0" is provided in Table 26.

Table 26. Interior Bent Summary: Range of Maximum Shear Forces for Displacements of 1/8" – 1"

Response Criteria	Service Limit State Range of Max Shear Forces @ Pile Top (kips)	
	Fixed Head	Free Head
Weak Soil Zone Encountered, Scour elevation at 83 feet	11.4 – 81.9	2.9 – 22.4
Weak Soil Zone Encountered, Scour elevation at 94 feet	25.1 – 154.2	6.6 – 48.3
Weak Soil Zone not Encountered, Scour elevation at 83 feet	11.5 – 82.8	2.9 – 22.7
Weak Soil Zone not Encountered, Scour elevation at 94 feet	25.1 – 154.4	6.6 – 48.3

Results of lateral pile analyses have been included in Appendix D.

7.5 Pile Driveability

A preliminary Wave Equation Analysis of Piles (WEAP) driveability analyses was conducted to evaluate potential hammer sizes that could be used to install the steel pipe piles. All pile driving hammers selected in the analysis were double-acting hydraulic hammers. The pipe pile wall thickness required to maintain pile compressive driving stresses within acceptable limits (Section 711.4.2 of the SCDOT 2007 Standard Specifications for Highway Construction) was 1.5 inches using 50 ksi steel.

A driveability analysis has been performed to evaluate pile installation stresses and pile driving equipment required to penetrate the Santee Limestone and underlying formations with and without plugging of the pipe pile. The evaluation was modeled with the weak soil zone, without the weak soil zone, and with 15% more skin and toe resistance. The evaluation conducted of the RBO Four Hole Swamp foundation used 48-inch steel pipe piles with 1.5-inch thick walls.

The WEAP analysis conducted is presented in Appendix E. A total pile length of 120 feet with 92% embedment was used for analysis. A variable frictional distribution and end bearing distribution was used in GRLWEAP based on the nominal pile resistances obtained from the APILE. The range of energy required for plugged and uplugged pipe piles was evaluated. Table 27 presents the soil input parameters used in the Wave Equation analyses.

Table 27. Driveability Analysis WEAP Input Parameters

Description	WEAP Parameter
Pile Type	48” Steel Pipe Pile with 1.5” walls
Skin Quake	0.10
Toe Quake	0.10
Skin Damping	0.05
Toe Damping	0.15
% Skin Friction	N/A
% End Bearing	N/A
Distribution Shape No.	Variable Resistance Distribution
Pile Penetration	110 ft
Hammer Rated Energy Range[1]	With Weak Soil Zone Unplugged: 56.7 kip-ft – 140.4 kip-ft Plugged: 94.0 kip-ft – 221.0 kip-ft Without Weak Zone Unplugged: 69.4 kip-ft – 172.8 kip-ft Plugged: 138.6 kip-ft – 342.9 kip-ft Reserve Capacity for hard layers Plugged: 187.9 kip-ft – 473.7 kip-ft

Notes:

[1] Hammer rated energy is based on GRLWEAP maximum rated energy database for hydraulic hammers.

The results of the WEAP pile driveability analyses indicate that a double-acting hydraulic pile driving hammer with a maximum rated energy of 340 to 475 ft-kip should be suitable for pile installation at interior bents. Larger hammers may be suitable but may require limiting the energy delivered.

For very hard or stiff soils (i.e. Santee Limestone) the inside of the pipe pile may need to be augered out in order to drive the pile. The inside of the pipe pile should not be augered out deeper than the bottom of the Santee Limestone Formation (elevation 30 ft-msl), and the final pile tip elevation must not be shallower than 20 feet below the augered depth.

8 BRIDGE APPROACH EMBANKMENT GEOTECHNICAL EVALUATION

The bridge approach embankments for US 301 Replacement Bridge over Four Hole Swamp have been evaluated for slope stability under the Service limit state and the Extreme Event I limit state. The bridge approach embankments evaluated in this report are within 150 feet from the bridge abutments in the longitudinal direction. Roadway embankments beyond 150 feet from the bridge abutments are not included in this report. The west and east bridge approach embankments will be raised approximately 2 feet in height.

8.1 Slope Stability

Global slope stability analyses for the Service and Extreme Event I limit state were conducted using Rocscience, Inc. slope stability software SLIDE 7.0. The global slope stability analyses were conducted in the longitudinal and transverse directions. The maximum bridge approach embankment height analyzed was 2 feet at Bents 1 and 8. Slope stability analyses assumed a groundwater table elevation of 110 ft-msl to account for seasonal variations to match the elevation of Four Hole Swamp.

The slope stability software uses soil shear strength parameters to estimate the slope stability margin of safety. The soil strength parameters selected for the slope stability analyses are based on Section 5 of this report. Circular failure surfaces have been modeled for the Service and Extreme Event I limit states to evaluate the global slope stability. The results of the slope stability analyses and the soil shear strengths used in the soil model are included in Appendix F.

8.1.1 Service Limit State Slope Stability (Static)

The Service limit state was used to evaluate the static slope stability in the longitudinal direction of bridge approach embankments. The Spencer method of analyzing slope stability was used to evaluate the Demand/Capacity ratio (D/C). The Service limit state analyses considered the short-term (during construction, total stress analysis) soil shear strengths for the east and west bridge approach embankments. For the short-term soil shear strength analyses only a live load surcharge (LS) was modeled with a uniform surcharge of 250 psf (Load Factor, γ = 1.0). For the long-term soil shear strength analyses, a uniform surcharge of 400 psf (Load Factor, γ = 1.0) was used to simulate the live load surcharge (LS) of 250 psf and a future dead load surcharge of 150 psf. A summary of the Service limit state (static) longitudinal global slope stability analyses and the governing Demand/Capacity ratios (D/C) and factor of safety, FS, (C/D) are provided in Table 28 and Table 29.

Table 28. Bent 1 Service Limit State Longitudinal Global Stability Summary

Slope Stability Location	Spencer Slope Stability Method Demand/Capacity, D/C (FS = C/D)[1]	Remarks
Short-Term Soil Shear Strengths Longitudinal Stability H_{Embk} = 2 feet End Bent 1 Station 5949+30	**0.621** **(1.611)**	Slope stability analysis shown in Appendix F. Slope stability D/C =0.621 (FS=1.611) meets the design criteria φ = 0.65 (FS=1.539)

Short-Term Soil Shear Strengths Longitudinal Stability H_{Embk} = 2 feet End Bent 8 Station 5952+24	**0.580** **(1.725)**	Slope stability analysis shown in Appendix F. Slope stability D/C = 0.580 (FS=1.725) meets the design criteria φ = 0.65 (FS=1.539)

[1] **Bold** values indicate governing Demand/Capacity ratio

8.1.2 Extreme Event I Limit State Slope Stability (Seismic)

The Extreme Event I limit state was used to evaluate the seismic slope stability in the longitudinal direction of the bridge approach embankments. The Spencer slope stability method was used to evaluate the Demand/Capacity ratio (D/C) and slope performance. The seismic soil shear strength properties were based on Section 5 of this report. Seismic loading was evaluated only for the Safety Evaluation Earthquake (SEE) in accordance with Section 4 of this report. For the Extreme Event I limit state a uniform surcharge of 275 psf (Load Factor, γ = 1.0) was used to simulate the live load surcharge (LS) of 125 psf (load factor, γ = 0.5) and a future dead load surcharge of 150 psf (load factor, γ = 1.0). The yield acceleration (C/D=FS=1.0) was computed when (D/C) SEE is greater 1.0 (FS < 1.0) to evaluate embankment performance based on displacements. Performance displacements were computed using Simplified Newmark Chart in accordance with GDM Section 13.16 (Equation 13-106). The results of the seismic slope stability analyses are provided in Appendix F.

A summary of the Extreme Event I limit state (seismic) global slope stability analyses Demand/Capacity ratios (D/C) and factor of safety, FS, (C/D) and estimated slope stability performance is provided in Table 30 and Table 31.

Table 30. End Bent 1 Extreme Event I Limit State Longitudinal Global Stability Summary

9 SCOPE OF WORK LIMITATIONS

The scope of work for this project was limited to specific analytical design consideration for this project. Additional design analyses and construction considerations will need to be addressed as the final design is completed. The following is a summary of design and construction considerations that will need to be addressed. This list is not all inclusive and attempts to provide some of the major design issues that need to be addressed.

Bridge Foundation

1. Analysis of end bent piles. The analysis of end bent piles has not been included since SCDOT did not include foundation loads or request that end bent piles be evaluated.
2. Pipe pile final pile length design based on governing limit state and site variability
3. Evaluation/design of deep foundation performance (i.e. settlement, lateral)
4. Bridge foundation plan notes

Embankment Foundation

1. Embankment final stability design/analyses for all limit states (Service limit state: short-term and long-term loading and Extreme Event I limit state) for the longitudinal and transverse directions
2. Evaluation/design of deep foundation performance (i.e. settlement, stability, etc.)
3. Embankment construction plan notes

10 GEOTECHNICAL ENGINEERING EVALUATION CONCLUSIONS

We have completed a preliminary geotechnical engineering evaluation for the US 301 southbound replacement bridge over Four Hole Swamp. The geotechnical engineering evaluation consisted of performing a review of the subsurface soil exploration, a soils shear strength loss (SSL) assessment, a review of the bridge interior bent foundations, and a review of embankment longitudinal slope stability. A summary of our conclusions is provided in the following sections.

10.1 Summary of Subsurface Exploration Evaluation and Soil Shear Strength Evaluation

A total of 23 soil test borings, 2 DMT profiles, and 6 shallow investigations (hand augers and bulk samples) were evaluated and combined with all laboratory test results to develop a site characterization consistent with the GDM (2010). Soils were categorized as either clay-like or sand-like based on the soil classification, fines content, and plasticity index. Soil shear strengths were evaluated for the static short-term and long-term loading conditions. The seismic soil shear strength loss (SSL) was also evaluated for the Safety Evaluation Earthquake (SEE) based on the potential for cyclic liquefaction of sand-like soils and cyclic softening of clay-like soils. A subsurface profile was developed for the project that identifies the soil stratigraphy based on clay-like and sand-like soils within geologic formations. Peak short-term soil shear strengths and soil shear strength losses have been annotated within the profile. Weak soil zones have been identified within the Warley Hill formation that underlies the Santee Limestone formation. A detailed evaluation has also been presented where there is a significant contrast between the two

subsurface investigations that have been conducted for this project. Subsurface exploration observations have also been presented to assist in the interpretation of the field and laboratory testing that was conducted for this project site.

10.2 Summary of Bridge Interior Bent Foundations

Three foundation alternatives were evaluated to determine feasibility based on evaluation of the subsurface investigations conducted at the bridge site. The original drilled shaft foundation was found to not be reasonable due to the permanent casing required through the weak soil zones encountered 60 feet below the ground at the interior bents and having to design drilled shaft capacity to start below the casing. The shallow foundation was also found not to be reasonable due to the construction requirements of using cofferdams that would be extremely difficult at bents 3 and 6 due to the deep scour at these locations and increased risk associated with placing a spread footing overlying weak soils that may be 22 to 32 feet below the bottom of the footing. The recommended bridge interior foundation that can reasonably be used to accommodate the existing soil conditions and provide reasonable performance is large diameter pipe piles with thick walls. Although large pipe piles (48-inch diameter, 1.5-inch wall thickness) are not commonly used on SCDOT projects, these foundations are currently being used by other State DOTs with increasing frequency and have performed well at project sites subject to seismic design.

Ultimate axial pile capacity results have been provided for the Bent 3 soil profile with and without the effects of encountering the weak soil zone. The results of lateral pile analyses have been included for soil profiles with and without the effects of encountering the weak soil zone. The lateral pile analyses have also considered the effects of scour occurring at Bent 3 (Scour elevation 83 feet) and at Bent 4/5 (Scour elevation 94 feet). A wave equation pile driveability evaluation has been performed to evaluate possible pile driving conditions that may occur such as encountering or not encountering the soil weak zone, effects of piles driving unplugged/plugged, and the possibility of encountering cemented zones within the Santee Limestone formation. Guidance has been provided for pile installation consideration with respect to pile driveability, pile driving equipment, and installation techniques to facilitate pile installation.

10.3 Summary of Longitudinal Slope Stability

Longitudinal slope stability analyses have been performed at each abutment for the Service limit state short-term loading condition and for the Extreme Event I limit state with seismic conditions based on the Safety Evaluation Earthquake (SEE). The resistance factor for the Service limit state for the short-term loading condition appears to meet or exceed the required resistance factor (Demand/Capacity). The Extreme Event I limit state slope stability analyses indicate that there will be no flow failure with resistance factors (Demand/Capacity) less than 1. The seismic slope stability indicates that the resistance factors Demand/Capacity) exceed the acceptable threshold of 1 requiring a Newmark displacement analysis. The displacement analysis indicates 6 inches of soil displacement along the failure circle at the bridge approach embankment adjacent to End Bent 1 and 2 inches of soil displacement along the failure circle at the bridge approach embankment adjacent to End Bent 8.

11 EVALUATION LIMITATIONS

We have prepared this Geotechnical Engineering foundation evaluation for use by SCDOT for the RBO Four Hole Swamp project in Orangeburg County, South Carolina. Within the limitations of scope, schedule and budget, our services have been executed in accordance with generally accepted practices in the field of geotechnical engineering in this area at the time this evaluation was prepared. No warranties, either expressed or implied, are intended or made. The analyses and recommendations presented in this evaluation are based upon the geotechnical site exploration and laboratory testing provided by others, information provided by SCDOT, and other information discussed in this evaluation. In the event that changes in the nature, design, or location of the project as outlined in this evaluation are planned, the conclusions and recommendations contained in this evaluation shall not be considered valid unless GeoStellar Engineering, LLC reviews the changes and either verifies or modifies the conclusions of this evaluation in writing. This evaluation does not reflect variations that may occur between borings, across the site, or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. If variations appear, GSE should be immediately notified so that further evaluation and supplemental recommendations can be provided.

Any electronic form or hard copy of this document (email, text, table, and/or figure), if provided, and any attachments are only a copy of a master document. The master hard copy is stored by GeoStellar Engineering, LLC and will serve as the official document of record.

RE: Revised Geotechnical Data Report
US 301 Bridge Replacement over Four Hole Swamp
Orangeburg County, South Carolina

Dear Ms. Stone,

We have completed the data report for the referenced project. ICA Engineering appreciates the opportunity to provide geotechnical services to the South Carolina Department of Transportation.

Sincerely,

ICA Engineering

Kenneth R. Bussey, Jr., P.E.
Project Engineer

Maegan L. Mansfield, EIT

APPENDICES

ICA Engineering

1. Project Information

This report provides a characterization of subsurface conditions for the US 301 Bridge Replacement over Four Hole Swamp in Orangeburg County, South Carolina. The geotechnical data presented herein includes standard penetration testing, bulk samples, hand auger borings, core extraction, a Multichannel Analysis of Surface Waves (MASW) survey, and laboratory tests. The subsurface information provides correlation with regional geological stratigraphy and site specific strata conditions to aid the South Carolina Department of Transportation (SCDOT) in the design and construction of the proposed project. A site vicinity map is included in Section I of the Appendix.

2. Site Conditions

2.1 Regional Geology

The proposed US 301 over Four Hole Swamp bridge site is located within the perimeter limits of the USGS, Indian Camp Branch 7.5 minute X 7.5 minute, topographic quadrangle map. This location places the bridge site southeast of the Orangeburg Scarp and within the Middle Coastal Plain physiographic province as defined in South Carolina. Published mapping and report data suggest the proposed project site lies within an alluvial floodplain eroded thru undifferentiated Pliocene sediments and onto middle Eocene sediments. Alluvial sediments (Holocene) are reportedly composed of sands with limited silt/clay components and typically non-plastic. Underlying middle Eocene sediments interpreted as Santee Limestone and Congaree Formation are reportedly composed of calcareous and shelly silts and sands, interbedded glauconitic and micaceous sands, and silicified clays, respectively. Lower Eocene sediments assigned to the Fishburne Formation are interpreted within published reports to underlie the Congaree Formation.

2.2 Site Geology

Sixteen (16) standard penetration test (SPT)/sample preliminary borings and four (4) hand auger preliminary borings were advanced to investigate the proposed bridge footprint, associated retaining walls, and inaccessible areas immediately adjacent to the structures. Nine (9) borings, B-1 thru B-9, were advanced at the bridge site while seven (7) borings, RW-1 thru RW-7, were advanced near retaining wall alignments. Generally, each boring is interpreted to have intercepted some combination of roadway embankment materials, alluvium, Santee Limestone sediments, Congaree Formation sediments, and if deep enough, Fishburne Formation sediments.

Laboratory testing of recovered SPT, hand auger, bulk samples, and core samples suggested five distinct strata intervals within the advanced bridge borings. Borings B-1, B-4, B-8, B-9, RW-1 thru RW-7, and HA-3 intercepted very loose to very dense, silty to rarely clayey, fine to medium grain sand with the fine to medium fractions roughly equal or less frequently, predominately medium grain (well sorted) sand or predominately fine grain (well sorted) sand, and traces to small fractions of silt interpreted as roadway embankment. Recovered samples typically exhibited non-plastic characteristics, though low plasticity and rarely medium plasticity samples were documented. These embankment materials were encountered at the surface then penetrated to depths of 2.2 feet to 7.7 feet.

Recovered samples of very loose to medium dense with rare dense, poorly to well sorted, fine, medium and coarse grain sands with trace to small fractions (rarely equal fractions) of silt, clay, and/or gravel were interpreted within each advanced boring and interpreted as alluvium. Alluvial deposits are typically non-plastic, but occasionally exhibit low plasticity characteristics as well. Thin layers of finely sandy, non-plastic silt or finely sandy, low plasticity clay were occasionally intercepted within the alluvial deposits. Alluvial samples were encountered at the surface for borings B-2, B-3, B-5, B-6, B-7, HA-1, HA-2, and HA-4. In all other borings alluvial samples were underlying roadway embankment.

Interpreted alluvial deposits thickness ranged from 5.4 feet to 20.7 feet with base of deposits ranging from elevation 102.9 feet to elevation 92.6 feet above MSL. Borings HA-1 thru HA-4 were terminated within alluvial deposits.

Alluvial deposits are interpreted to directly overlie Santee Limestone sediments at the project site. Santee sediments typically were comprised of calcareous (strongly reactive), fine grain to occasionally medium grain sand with some to nearly half of the sample silt, and trace to small fractions of gravel within scattered samples or alternatively comprised of calcareous silt with significant fractions of fine grain sand. Rare samples comprised of fine to medium grain sand and clay were also recovered. Cementation of the Santee sediments varied from weak to strong thus resulting in SPT values equating to medium dense to very dense or very stiff to hard, with a rare loose layer immediately underlying alluvial deposits. Cementation was sufficient to support coring of intervals within the Santee sediments in borings B-5, B-6, B-7 and B-8. Recovered samples were described as very weak to weak, calcareous, fossiliferous, shelly, fine to medium grain sandstone or very weak to weak fossiliferous, shelly, very fine to fine grain calcarenite. Thin beds of medium strong sediments were noted and tested within the calcareous sandstone and noted within the calcarenite. Core recovery varied from 46 percent to 100 percent, with most runs greater than 70 percent. Core RQD varied from 0 percent to 64 percent, with most runs 40 percent or less. Selected core samples were subjected to unconfined compression testing with calcareous sandstone samples ranging from 261 psi to 4,688 psi and calcarenite samples ranging from 116 psi to 643 psi. Santee sediments are interpreted to be 49.3 feet to 74.2 feet in thickness with the Santee base ranging from elevation 50.1 feet to elevation 23.9 feet above MSL. Borings B-6, B-7, and RW1 thru RW-7, were terminated within Santee sediments.

Sediments interpreted as Congaree Formation underlie Santee sediments at the bridge site. Sediments exhibited non-plastic characteristics, very loose to very dense compaction, and were composed

of medium grain sand with smaller fractions of both fine and coarse grain sizes, contain traces of silt and gravel, were micaceous, glauconitic, and occasionally strongly cemented. Congaree sediments appear to be 35.0 feet to 41.3 feet thick at the subject bridge site. Borings B-1, B-4, B-5, B-8 and B-9 were terminated within Congaree Formation sediments.

Borings B-2 and B-3 penetrated Congaree sediments to encounter medium dense to dense, fine grain sand with equal fractions of silt, and small fractions of medium grain sand. Published documents suggest these sediments to be lower Eocene Fishburne Formation. This material was penetrated to depths of 108.0 feet and 100.0 feet in borings B-2 and B-3, respectively. These depths equate to elevations of 0.9 feet and 8.8 feet above MSL.

SPT refusal was encountered at different levels within fourteen (14) of the advanced borings. In each case, with the exception of two (2) instances, visual observation indicated strong cementation to be the factor linked to refusal. Santee sediments in particular exhibited widely varying cementation levels at variable elevations but not necessarily correlative from boring to boring. Congaree sediments also exhibited thin seams of moderate to strong cementation but not to the vertical extent of the Santee strata unit. Two (2) instances of SPT refusal at shallow depths were upon the apparent interception of existing bridge footings in borings B-4 and B-6.

3. Field Exploration Program

ICA Engineering, Inc. (ICA) advanced a total of sixteen (16) SPT borings. As previously stated, nine (9) SPT borings (B-1 through B-9) were drilled at the proposed bridge site and seven (7) SPT borings (RW-1 through RW-7) were drilled near the proposed retaining walls. Two (2) bulk samples (Bulk-1 and Bulk-2) were obtained in the bridge borings. Four (4) hand auger borings (HA-1 through HA-4) were also conducted. An MASW survey was also performed near the bridge site. Table 1 lists the subsurface testing conducted for the described investigation.

Table 1: Subsurface Testing Locations

HA-2	5949+00	60’ RT	7.5	N/A
HA-3	5952+23	40’ RT	10.5	N/A
HA-4	5952+54	42’ RT	3.5	N/A

The SPT borings were advanced by a CME-45C track-mounted drill rig using rotary wash and casing techniques. Two (2) bridge borings, B-5 and B-8, encountered casing refusal at 10.0 feet and 30.4 feet, respectively. Borings B-5 and B-8 returned to sampling at 31 feet and 51.3 feet, respectively, and did not encounter casing refusal thereafter. Borings B-6 and B-7 encountered casing refusal at depths ranging between 15.2 feet and 20 feet. The remaining bridge borings did not encounter casing refusal and all borings were terminated at depths ranging between 41 feet to 111.5 feet. Two (2) bulk samples were taken at depths of five (5) feet in borings B-1 and B-8.

The retaining wall borings were drilled to an approximate depth of 41 feet, except where SPT refusal occurred. SPT refusal occurred in borings RW-3, RW-4, RW-6, and RW-7, at depths ranging

between 20.9 feet to 30.7 feet. Hand auger borings were terminated at depths ranging from 3.5 feet to 10.5 feet. Terracon also performed one (1) MASW survey.

Recovered SPT samples along with the rock cores were delivered to ICA's laboratory for testing and analysis. Plan sheets depicting the locations of the borings are presented in Section II of the Appendix. Boring logs are presented in Section III and the results of the laboratory testing are presented in Section IV. The results of the MASW survey are depicted in Section V.

3.1 Standard Penetration Testing

SPT borings were terminated at depths ranging from 20 feet to 111.5 feet. Boring logs are presented in Section III of the Appendix. In all borings, except boring B-4, standard penetration tests were conducted at 2 foot intervals in the top 10 feet and at 5 feet intervals until achieving casing refusal or the boring termination depths. During drilling operations of boring B-4, the concrete bridge footing was penetrated at a depth range of 3.3 feet to 4.8 feet; thus a sample was not taken at the standard 4.0 foot interval. Normal SPT sampling procedures were conducted throughout the remainder of the boring. It should be noted that the N-values presented in the boring logs are the uncorrected, field N-values. Blow counts recorded at these intervals were produced from a standard penetration test hammer with an energy ratio of 79% for the CME-45C drill rig. The recent hammer report is included in Section VI of the Appendix.

3.2 MASW Survey

Multichannel analysis of surface waves (MASW) is a seismic method that uses the dispersive characteristics of Rayleigh-type surface waves to determine the variation of the shear wave velocity of layered systems with depth. Unlike spectral analysis of surface waves (SASW) which can get overwhelmed by noise and other artificial source waves, the MASW method can identify and reject non-fundamental Rayleigh waves and noise; thereby it can focus the data collection on the Rayleigh waves.

Refraction Microtremor (ReMi) and Microtremor Array Measurement (MAM) are two methods of passive source techniques to measure noise. In both, lower frequency surface waves arising from microtremors and/or noise, such as traffic, are recorded using linear or two dimensional arrays of geophones. Due to the shortcomings of techniques being performed along and the advantages offered through their combined use, Terracon used MAM in conjunction with MASW for the development of this survey.

The result of this one (1) survey was an average shear wave velocity in the top 100 feet of 1082.7 feet per second and the coefficient of variability (COV) is 0.44. Therefore, based on this one (1) result, we would recommend that the site would classify as Site Class D in accordance with Step 2 of Table 12-20 in the SCDOT Geotechnical Design Manual (GDM). The result of the MASW test is shown in Section IV of the Appendix. The location is also shown as SA-1 on the test location plans in Section II of the Appendix.

4. Laboratory Testing Program

Laboratory tests performed on representative samples were selected by SCDOT. Procedures included natural moisture content of soils, Atterberg limits, sieve analysis, AASHTO and ASTM soil classification, unconfined compression, and direct shear testing. Table 2 summarizes the testing performed and quantity of each test. Laboratory results are presented in Section IV of the Appendix.

Table 2: Laboratory Testing

Test Type	Quantity
Atterberg Limits	70
#200 wash	85
Hydrometer	14
Natural Moisture Content	69
Unconfined Compression (Rock)	17
Direct Shear	2

5. Limitations to Report

Discussion of geologic and geotechnical conditions observed in the field, observed from field sample recovery, observed in laboratory examination of samples and computed data analysis, which are all quantified in this data report, should be considered preliminary investigation and are subject to change upon the acquisition of additional data during the final investigation. No other warranty, express or implied, is made. The Geotechnical Engineer of Record for the project must review the data submitted in this report and develop their own interpretation of the testing results as they apply to design.

Appendix Section III
Soil Test Boring Logs

Field Exploration Description

Overview

The testing locations were chosen by SCDOT using aerial photography and landmarks. Stations and offsets were estimated using aerial photography and existing drawings. The borings were surveyed by Carolina Surveying Services after drilling was complete. The locations shown in the Exploration and Location Plan should be considered accurate only to the degree implied by the means and methods used to define them.

A field log of each test was prepared by field personnel. These logs included visual classifications of the materials encountered during drilling as well as the driller's interpretation of the subsurface conditions between samples. Final boring logs included with this report represent the engineer's interpretation of the field logs and include modifications based on laboratory observation and tests of the samples.

Soil Test Borings

All boring and sampling operations were conducted in accordance with the following procedures:

- SCDOT Geotechnical Design Manual 2010
- ASTM D5783, "Standard Guide for Use of Direct Rotary Drilling with Water-Based Drilling Fluid for Geoenvironmental Exploration"
- ASTM D1586, "Test Method for Penetration Test and Split-Barrel Sampling of Soils"
- ASTM D4220, "Standard Practices for Preserving and Transporting Soil"

Unless noted otherwise, at 2 foot intervals within the upper 10 feet and 5 foot intervals thereafter, soil samples were obtained with a standard 1.4 inch I.D., 2 inch O.D., split-barrel sampler, also known as a standard split-spoon. The sampler is advanced into the soil a total of 18 inches by striking the drill rod using a 140-pound safety or automatic hammer falling 30 inches. The number of blows required to advance the sampler for each of three 6 inch increments is recorded. The sum of the number of blows for the second and third increments is called the "Standard Penetration Value", or N-value (Nmeas) (blows per foot). The N-value, when properly evaluated, is an index to the soil strength.

Soil Classification provides a general guide to the engineering properties of various soil types and enables the engineer to apply his experience to current situations. In our exploration, samples obtained during drilling operations are examined and visually classified by a geotechnical engineer using the procedures outlined in ASTM D2487 "Standard Classification of Soils for Engineering Purposes" (Unified Soil Classification system). Laboratory testing was also performed on select split-spoon samples to evaluate index properties for further classification. The soils are described according to color, texture, and relative density or consistency (based on standard penetration resistance). The designations shown on the logs are described on the following page.

Data Set ID	Instru-mentation to Sampler Tip Length (ft.)(1)	Blows Recorded to Drive Sampler/N-value	Soil Sample Description	Average BPM for Increment	Average Maximum Energy (k-ft.)	Average Energy Transfer Ratio (percent)
1	33.6	14-20-17 / 37	Brown Sand	51.4	0.27	77.2
2	38.6	17-36-37 / 73	Brown Sand with Trace Quartz Fragments	51.5	0.28	79.9
3	43.6	8-14-14 / 28	Brown Sand with Mica, Some Silt	52.0	0.27	78.2
4	48.6	2-8-14 / 22	Brown Sand with Mica, Some Silt	49.8	0.28	79.6
5	53.6	18-18-16 / 34	Brown Sand with Mica, Some Silt	53.2	0.28	79.2

1. Penetration below grade is approximately 2.5 to 4.0 feet less than length shown for instrumentation to sampler tip for each increment.

Energy Measurement Interpretation

Five increments of data were gathered. The averages for energy (EFV) and the energy transfer ratio (ETR) for each increment are tabulated in the above table. In addition, the above table includes the N-value and soil sample description for each increment. Plots of average ETR versus rod length below instrumentation and ETR for each blow versus rod length below instrumentation are included in Appendix A. Additional information regarding each blow recorded for each increment can be found in Appendices B through F. A plot showing representative force and velocity traces, input parameters, gage information, and output quantities is also included in Appendices B through F for a representative blow for each increment. Please note in the attached plots in Appendices B through F the penetration is estimated and based on depth of the tip of the sampler below existing ground. Refer to the LE values in the tabulated date and plots for the actual rod length below gages.

The overall average EFV and ETR values (for all recorded blows for the last three increments only) are approximately 0.28 k-ft and 79.0 percent, respectively. The standard deviation for all data for only the last three increments for EFV and ETR are 0.01 k-ft or 1.51 percent, respectively. Increment 1 and 2 are not used in the overage average EFV and ETR because

the N-value is higher than 50 for Increment 2. The overall average EFV and ETR values for all five increments including Increments 1 and 2 are approximately 0.28 k-ft and 79.0 percent, respectively.

Limitations

This report presents test measurements made by AFT. Interpretations were made based upon the measurements made by AFT with the latest techniques available and currently accepted standards of care recognized by Geotechnical Engineering professionals. AFT is an independent agency and is not the Geotechnical Engineer of Record. The Geotechnical Engineer of Record should ultimately make final recommendations for foundation design and construction.

SUBJECT: Geotechnical Subsurface Data Report
Proposed Bridge Replacement
US 301 (Five Chop Road) Bridge over Four Hole Swamp
Orangeburg County, South Carolina
PSI Report No. 0451644

Dear Ms. Sara Stone, PE and Ms. Renee Gardner, PE:

Professional Service Industries, Inc. (PSI) is pleased to submit this Geotechnical Subsurface Data Report for the proposed US 301 (Five Chop Road) Bridge Replacement Bridge over Four Hole Swamp in Orangeburg County, South Carolina. This report summarizes the work accomplished and provides our collected field and laboratory data for your design and construction purposes of the proposed replacement bridge structure.

PSI appreciates the opportunity to contribute our services for this project and looks forward to working with you during design and construction of this project, as appropriate. Please contact the undersigned directly if you have questions pertaining to this project.

Respectfully Submitted,

PROFESSIONAL SERVICE INDUSTRIES, INC.

Richard E. Finnen, Jr., P.E.
Principal Consultant

R. Thomas Cannarella, P.E.
Branch Manager

PROJECT DESCRIPTION AND SCOPE

This report presents the data of a subsurface exploration completed by Professional Service Industries, Inc. (PSI) for the proposed US 301 (Five Chop Road) Bridge Replacement over Four Hole Swamp, Orangeburg County, South Carolina. PSI understands that the existing bridge structure will be replaced with a new seven span bridge structure at the same general location. Based on the limited information provided, it is our understanding that previous geotechnical investigations/explorations have been completed by others. PSI has been provided with copies of three (3) soil test boring logs (B-3, B-5, RW-3) in which were performed by others for reference purposes only.

The objective of our work was to collect additional subsurface data at the bridge location to supplement the previous investigation and evaluations performed by others. More specifically, there were very loose SAND layers between 50 feet and 80 feet below ground surface that were observed in Soil Test Borings B-3 and B-5 (performed by others). In addition, there is a very soft lean CLAY layer between approximately 9 feet and 13 feet below ground surface that was observed in Soil Test Boring RW-3 (performed by others).

We explored the site by performing five (5) soil test borings (B-1A, B-3A, B-5A, B-6A, B-7A) to depths of as deep as approximately 120 feet below ground surface using mud rotary drilling techniques, two (2) soil test borings (RW-3A and RW-3B) up to approximately 16 feet below ground surface using hollow stem auger drilling techniques, and two (2) Dilatometer Test Soundings (DMT-1 and DMT-2) to approximately 15 feet below the ground surface. Soil Test Borings were performed using a truck-mounted CME-55 drill rig, except for RW-3A and RW-3B were performed using a truck-mounted CME-45D drill rig. The locations of the explorations are shown on the Boring Location Survey within the Appendix of this report.

All soil test boring locations were accessed by a truck mounted drill rig while one lane of US Route 301 was temporarily closed. PSI performed all field work between the dates of December 4, 2014 and January 29, 2015. Site and soil conditions have been documented in the photographs provided within the Appendix of this report. After the field work was completed, all soil test borings were surveyed by a Licensed Land Surveyor and shown on the attached Boring Location Survey within the Appendix of this Report providing locations and elevations.

Soil samples obtained during the field explorations were examined in our laboratory. The physical characteristics of the samples were noted and the field classifications were modified where necessary

in accordance with terminology presented the General Notes included in this appendix.

Representative samples were selected by SCDOT during the course of soil test boring log examination and requested for further laboratory testing. The laboratory program requested included determinations of Natural Moisture Content, Atterberg Limits, #200 Sieve Wash, Hydrometer Analysis, Organic Loss, Consolidation Test, Triaxial Compression Test, and Corrosion Series Tests. All Tests were performed in general accordance with the proper ASTM Standards and the SCDOT Geotechnical Design Manual.

Our services were conducted in general accordance with our work order number 40308 dated 11-14-2014 and the SCDOT Geotechnical Design Manual.

SITE DESCRIPTION

The bridge site is located where Route 301 crosses Four Hole Swamp (southbound) in Orangeburg County, South Carolina (approximate Latitude 38.4575, Longitude -80.6478), about 1.3 miles north of its intersection with Rt. 167, between mile marker 27.86 and 28.21. The existing bridge structure spans in an approximate east-west direction approximately 334 feet across Four Hole Swamp. The proposed bridge replacement is expected to be in the same general location and will consist of 7 spans and approximately 334 feet in length.

Elevation of the top of the existing roadway within the area of the subsurface explorations ranges between El 119.85 and El 120.26 feet, while the water level in Four Hole Swamp at the time of the drilling of the soil test borings was approximately El 110.15 feet. The mudline within Four Hole Swamp was also determined to have a range of approximately El 107.6 to El109.1 feet.

LIMITATIONS

This report has been prepared to aid the SCDOT design team in the design and construction of the US 301 (Five Chop Road) Bridge Replacement over Four Hole Swamp in Orangeburg County, South Carolina. The scope is limited to this specific project and location described herein, and our description of the project represents our understanding of the significant aspects of the project relevant to the design and construction of the bridge structure and associated highway improvements. In the event that any changes in the design or location of the alignment or structure, as outlined in this report, are planned, we should be given the opportunity to review the changes and to modify or

reaffirm the conclusions and recommendations of this report in writing.

The field and laboratory data submitted in this report are based on the information obtained from the borings made at the locations indicated on the Boring Location Survey, and from other sources of information discussed in this report. In the performance of subsurface exploration, specific information is obtained at specific locations at specific times. However, it is acknowledged that variations in soil conditions may exist between boring locations. This report does not reflect any variations that may occur between these explorations. The nature and extent of variation may not become evident until construction. If, during construction, subsurface conditions different from those encountered in the explorations are observed or encountered, we should be advised at once so that we can observe and review these conditions and reconsider our recommendations where necessary.

FIELD EXPLORATION PROGRAM

General

We explored the site by drilling five (5) soil test borings (B-1A, B-3A, B-5A, B-6A, B-7A) using mud rotary drilling techniques, two (2) soil test borings (RW-3A and RW-3B) using hollow stem auger drilling techniques and two (2) Dilatometer Test Soundings (DMT-1 and DMT-2) up to depths of approximately 120 feet, 16 feet, and 15 feet below the ground surface (bgs), respectively. Soil Test Borings were performed using a truck-mounted CME-55 drill rig, except for RW-3A and RW-3B were performed using a truck-mounted CME-45D drill rig. The locations of the explorations are shown on the Boring Location Survey within the Appendix of this report.

Drilling Sampling Procedures

Standard penetration tests were carried out while representative samples were being retrieved at selected depths in the borehole. Throughout the drilling operation, soil samples were obtained from the borings using a 3¼-inch (O.D.) split spoon sampler in general conformance with guidelines presented in ASTM D1586, Standard Test Method for Penetration Test and Split Barrel Sampling of Soils. The samplers were driven into the soil a distance of 18 – 24 inches or to refusal with a 140-pound hammer free falling a distance of 30 inches. The numbers of the blows required to drive the sampler in three 6-inch increments are provided in the boring logs. The sum of blows for the last two increments (or middle two increments for the 24 inch Split Barrel sampling that was performed during continuous sampling depths) was recorded as the standard penetration resistance, or N-value. When the sampler met practical refusal, the number of inches driven and the number of blows was recorded.

Soil samples were examined in the field and representative portions were stored in sealable plastic jars. The samples were transported to PSI's laboratory for further examination and testing.

Rock Coring

Rock coring was not necessary.

Field Classification

Soil samples were initially classified visually in the field. Consistency, color, relative moisture, degree of plasticity, peculiar odors and other distinguishing characteristics of the soil samples were noted. The terminology used in the soil and rock classifications and other modifiers are defined in the General Notes in this appendix.

Drilling Exploration Logs

Summary soil test boring logs follow in this appendix, and have been prepared in general accordance with SCDOT standards. The left-hand portion of the exploration log gives our description of the soil and rock encountered in the exploration, laboratory test results, and depth to groundwater, if encountered. The right-hand portion of the log shows SPT data, sample locations and depths, and a graphical representation of the laboratory results at the respective depths.

The soil stratifications shown on the boring logs represent the conditions only at actual exploration location. Variations may occur and should be expected. The stratifications represent the approximate boundary between subsurface materials; the actual transition may be gradual.

LABORATORY TESTING PROGRAM

General

Soil samples obtained during the field explorations were examined in our laboratory. The physical characteristics of the samples were noted and the field classifications were modified where necessary in accordance with terminology presented the General Notes included in this appendix.

Visual-Manual Classification

The soil samples were classified in general accordance with guidelines presented in ASTM D2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure). Certain terminologies incorporating current local engineering practice, as provided in the Soil Classification Chart are included with or in lieu of ASTM terminology. The term which best described the major portion of the sample was used in determining the soil type (that is, gravel, sand, silt or clay).

Laboratory Testing

Representative samples were selected by SCDOT during the course of soil test boring log examination and requested for further testing. Undisturbed samples were extruded and selected for engineering property tests, as directed by SCDOT Engineers. The laboratory program requested included determinations of Natural Moisture Content, Atterberg Limits, #200 Sieve Wash, Hydrometer Analysis, Organic Loss, Consolidation Test, Triaxial Compression Test, and Corrosion Series Tests. All Tests were performed in general accordance with the proper ASTM Standards and the SCDOT Geotechnical Design Manual.

ASTM G51/AASHTO T289

Standard Test Method for Determining pH of Soil for Use in Corrosion Testing

SAMPLE PREPARATION

Air dried Material passing #10 sieve was used for testing.

TEST DATA

T.E.S.T. Sample ID	Client Sample ID	pH meter Reading	Reported pH
19241	B-1A SS-7	3.90	**3.9**

Standard buffer solutions used to standardize pH meter:

4.0 pH

7.0 pH

10.0 pH

pH Meter ID 375

Parameters for Specimen No. 2

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	140.180			1057.070
Moisture content: Dry soil+tare, gms.	131.910			894.600
Moisture content: Tare, gms.	89.540			87.780
Moisture, %	19.5		20.1	20.1
Moist specimen weight, gms.	970.9			
Diameter, in.	2.81		2.86	
Area, in.²	6.20		6.44	
Height, in.	4.55		4.47	
Net decrease in height, in.		0.03	0.05	
Net decrease in water volume, cc.			9.90	
Wet density, pcf	131.2		129.0	
Dry density, pcf	109.7		107.3	
Void ratio	0.4961		0.5296	
Saturation, %	103.5		100.0	

Test Readings for Specimen No. 2

Membrane modulus = 0.124105 kN/cm²
Membrane thickness = 0.02 cm
Filter paper coefficient = 0.001926 kN/cm
Filter paper coverage = 50%
Consolidation cell pressure = 28.90 psi (2.081 tsf)
Consolidation back pressure = 15.00 psi (1.080 tsf)
Consolidation effective confining stress = 1.001 tsf
Strain rate, in./min. = 0.02
Fail. Stress = 1.472 tsf **at reading no.** 19
Ult. Stress = 1.472 tsf **at reading no.** 19

ASTM G 57/G187/AASHTO T 288

Standard Test Method for Determining Minimum Laboratory Soil Resistivity

Determination of Resistivity at as-received moisture content

As-received Moisture Content	
Mass of Wet Sample & Tare, g	
Mass of Dry Sample & Tare, g	
Mass of Tare, g	
Moisture Content, %	NA

Remarks

TEST DATA

Mass of Soil Box, g	-	Meter Dial Reading, ohms	-
Mass of Soil Box + Soil, g	-	Reading of Meter Range Multiplier	-
Mass of Soil, g	-	Measured Resistance, ohms	-
Calibrated Volume of Soil Box, ft^3	0.0027	Calibrated Soil Box Multiplier, cm	1.0
Wet Density of as-placed Soil, pcf	-		
Dry Density of as-placed Soil, pcf	-	**Reported Soil Resistivity, ohms-cm**	**NA**

Determination of Minimum Soil Resistivity

TEST DATA

	Trials at Various Moisture Content								
TRIAL #	1	2	3	4	5	6	7	8	9
Meter Dial Reading, ohms	3.00	2.00	1.80	1.80					
Reading of Meter Range Multiplier	1000	1000	1000	1000					
Measured Resistance, ohms	3000	2000	1800	1800					
Calibrated Soil Box Multiplier, cm	1.0	1.0	1.0	1.0					
Measured Resistivity, ohms-cm	3000	2000	1800	1800					

Reported Soil Minimum Resistivity, ohms-cm **1800**

Note: Material passed # 10 sieve used for testing

Oven ID #	12/13/14/15
Balance ID #	1/2/6
Soil Box ID #	112
Resistivity Meter ID #	111/396

GENERAL NOTES

SAMPLE IDENTIFICATION

The Unified Soil Classification System (USCS), AASHTO 1988 and ASTM designations D2487 and D-2488 are used to identify the encountered materials unless otherwise noted. Coarse-grained soils are defined as having more than 50% of their dry weight retained on a #200 sieve (0.075mm); they are described as: boulders, cobbles, gravel or sand. Fine-grained soils have less than 50% of their dry weight retained on a #200 sieve; they are defined as silts or clay depending on their Atterberg Limit attributes. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size.

DRILLING AND SAMPLING SYMBOLS

SFA: Solid Flight Auger - typically 4" diameter flights, except where noted.
HSA: Hollow Stem Auger - typically 3¼" or 4¼ I.D. openings, except where noted.
M.R.: Mud Rotary - Uses a rotary head with Bentonite or Polymer Slurry
R.C.: Diamond Bit Core Sampler
H.A.: Hand Auger
P.A.: Power Auger - Handheld motorized auger

SS: Split-Spoon - 1 3/8" I.D., 2" O.D., except where noted.
ST: Shelby Tube - 3" O.D., except where noted.
RC: Rock Core
TC: Texas Cone
BS: Bulk Sample
PM: Pressuremeter
CPT-U: Cone Penetrometer Testing with Pore-Pressure Readings

SOIL PROPERTY SYMBOLS

N: Standard "N" penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2-inch O.D. Split-Spoon.
N_{60}: A "N" penetration value corrected to an equivalent 60% hammer energy transfer efficiency (ETR)
Q_u: Unconfined compressive strength, TSF
Q_p: Pocket penetrometer value, unconfined compressive strength, TSF
w%: Moisture/water content, %
LL: Liquid Limit, %
PL: Plastic Limit, %
PI: Plasticity Index = (LL-PL),%
DD: Dry unit weight, pcf
▼,▽,⧩ Apparent groundwater level at time noted

RELATIVE DENSITY OF COARSE-GRAINED SOILS

Relative Density	N - Blows/foot
Very Loose	0 - 4
Loose	4 - 10
Medium Dense	10 - 30
Dense	30 - 50
Very Dense	50 - 80
Extremely Dense	80+

ANGULARITY OF COARSE-GRAINED PARTICLES

Description	Criteria
Angular:	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular:	Particles are similar to angular description, but have rounded edges
Subrounded:	Particles have nearly plane sides, but have well-rounded corners and edges
Rounded:	Particles have smoothly curved sides and no edges

GRAIN-SIZE TERMINOLOGY

Component	Size Range
Boulders:	Over 300 mm (>12 in.)
Cobbles:	75 mm to 300 mm (3 in. to 12 in.)
Coarse-Grained Gravel:	19 mm to 75 mm (¾ in. to 3 in.)
Fine-Grained Gravel:	4.75 mm to 19 mm (No.4 to ¾ in.)
Coarse-Grained Sand:	2 mm to 4.75 mm (No.10 to No.4)
Medium-Grained Sand:	0.42 mm to 2 mm (No.40 to No.10)
Fine-Grained Sand:	0.075 mm to 0.42 mm (No. 200 to No.40)
Silt:	0.005 mm to 0.075 mm
Clay:	<0.005 mm

PARTICLE SHAPE

Description	Criteria
Flat:	Particles with width/thickness ratio > 3
Elongated:	Particles with length/width ratio > 3
Flat & Elongated:	Particles meet criteria for both flat and elongated

RELATIVE PROPORTIONS OF FINES

Descriptive Term	% Dry Weight
Trace:	< 5%
With:	5% to 12%
Modifier:	>12%

GENERAL NOTES

(Continued)

CONSISTENCY OF FINE-GRAINED SOILS

Q_U - TSF	N - Blows/foot	Consistency
0 - 0.25	0 - 2	Very Soft
0.25 - 0.50	2 - 4	Soft
0.50 - 1.00	4 - 8	Firm (Medium Stiff)
1.00 - 2.00	8 - 15	Stiff
2.00 - 4.00	15 - 30	Very Stiff
4.00 - 8.00	30 - 50	Hard
8.00+	50+	Very Hard

MOISTURE CONDITION DESCRIPTION

Description	Criteria
Dry:	Absence of moisture, dusty, dry to the touch
Moist:	Damp but no visible water
Wet:	Visible free water, usually soil is below water table

RELATIVE PROPORTIONS OF SAND AND GRAVEL

Descriptive Term	% Dry Weight
Trace:	< 15%
With:	15% to 30%
Modifier:	>30%

STRUCTURE DESCRIPTION

Description	Criteria
Stratified:	Alternating layers of varying material or color with layers at least ¼-inch (6 mm) thick
Laminated:	Alternating layers of varying material or color with layers less than ¼-inch (6 mm) thick
Fissured:	Breaks along definite planes of fracture with little resistance to fracturing
Slickensided:	Fracture planes appear polished or glossy, sometimes striated
Blocky:	Cohesive soil that can be broken down into small angular lumps which resist further breakdown
Lensed:	Inclusion of small pockets of different soils
Layer:	Inclusion greater than 3 inches thick (75 mm)
Seam:	Inclusion 1/8-inch to 3 inches (3 to 75 mm) thick extending through the sample
Parting:	Inclusion less than 1/8-inch (3 mm) thick

SCALE OF RELATIVE ROCK HARDNESS

Q_U - TSF	Consistency
2.5 - 10	Extremely Soft
10 - 50	Very Soft
50 - 250	Soft
250 - 525	Medium Hard
525 - 1,050	Moderately Hard
1,050 - 2,600	Hard
>2,600	Very Hard

ROCK BEDDING THICKNESSES

Description	Criteria
Very Thick Bedded	Greater than 3-foot (>1.0 m)
Thick Bedded	1-foot to 3-foot (0.3 m to 1.0 m)
Medium Bedded	4-inch to 1-foot (0.1 m to 0.3 m)
Thin Bedded	1¼-inch to 4-inch (30 mm to 100 mm)
Very Thin Bedded	½-inch to 1¼-inch (10 mm to 30 mm)
Thickly Laminated	1/8-inch to ½-inch (3 mm to 10 mm)
Thinly Laminated	1/8-inch or less "paper thin" (<3 mm)

ROCK VOIDS

Voids	Void Diameter
Pit	<6 mm (<0.25 in)
Vug	6 mm to 50 mm (0.25 in to 2 in)
Cavity	50 mm to 600 mm (2 in to 24 in)
Cave	>600 mm (>24 in)

GRAIN-SIZED TERMINOLOGY

(Typically Sedimentary Rock)

Component	Size Range
Very Coarse Grained	>4.76 mm
Coarse Grained	2.0 mm - 4.76 mm
Medium Grained	0.42 mm - 2.0 mm
Fine Grained	0.075 mm - 0.42 mm
Very Fine Grained	<0.075 mm

ROCK QUALITY DESCRIPTION

Rock Mass Description	RQD Value
Excellent	90 -100
Good	75 - 90
Fair	50 - 75
Poor	25 -50
Very Poor	Less than 25

DEGREE OF WEATHERING

Slightly Weathered: Rock generally fresh, joints stained and discoloration extends into rock up to 25 mm (1 in), open joints may contain clay, core rings under hammer impact.

Weathered: Rock mass is decomposed 50% or less, significant portions of the rock show discoloration and weathering effects, cores cannot be broken by hand or scraped by knife.

Highly Weathered: Rock mass is more than 50% decomposed, complete discoloration of rock fabric, core may be extremely broken and gives clunk sound when struck by hammer, may be shaved with a knife.

SOIL CLASSIFICATION CHART

NOTE: DUAL SYMBOLS ARE USED TO INDICATE BORDERLINE SOIL CLASSIFICATIONS

APPENDIX B

SPT CORRECTIONS, SOIL SHEAR STRENGTH, AND SEISMIC HAZARD EVALUATION

GeoStellar Engineering

APPENDIX B
SPT CORRECTIONS, SOIL SHEAR STRENGTH, AND SEISMIC HAZARD EVALUATION

Details of SPT sampling depths, penetration results, soil classification, and hammer energy ratio are presented in Appendix A. The SPT testing results were first corrected and then correlated to static soil shear strengths. Seismic soil shear strengths were evaluated by first screening for soils susceptible to soil shear strength loss (SSL) and then evaluating if soil SSL could be triggered by the SEE design events. If soil SSL was not triggered by the SEE design event, it was assumed that the FEE design event would also not trigger soil SSL. Seismic soil shear strengths were determined based on correlations with SPT results after evaluating if the soils are subject to cyclic softening, full cyclic liquefaction, or limited cyclic liquefaction.

SPT CORRECTIONS

The SPT penetration field results, N_{Meas}, were corrected for energy losses in order to obtain N_{60} and N^*_{60}. The energy corrected N^*_{60} blow counts were then normalized to a reference overburden pressure of 1 tsf (1 atm) to obtain a normalized $N^*_{1,60}$. The SPT N_{60} and $N^*_{1,60}$ were used to evaluate the static soil shear strengths. The energy corrections and overburden corrections used are in accordance with the 2010 SCDOT GDM, Section 7.8.1.1 and Section 13.11.1. The SPT $N^*_{1,60}$ values were also corrected for fines content to equivalent clean sand SPT $N^*_{1,60,cs}$ blow counts that were used to evaluate soil shear strength loss (SSL). The fines content correction used was in accordance with the 2010 SCDOT GDM, Table 13-7.

STATIC SOIL SHEAR STRENGTH

The SPT N_{60} blow counts were used to obtain total soil shear strength (cohesion, c) for cohesive soils and SPT $N^*_{1,60}$ was used to obtain effective shear strength (internal friction angle, ϕ') for cohesionless soils based on correlations obtained from the 2010 SCDOT GDM, Sections 7.10 for and 7.11. Effective (drained) soil shear strengths of clay-like soils typically used in long-term drained analyses were computed, and recommended effective soil shear strength parameters for clay-like soils are included in the main report.

An internal angle of friction was assigned for sand-like soils (typically: FC $\leq$ 20% or PI < 7) and a cohesion was assigned and for clay-like soils (typically: FC > 20% and PI $\geq$ 7) by using the appropriate SCDOT correlations. The computed shear strength parameters (internal angle of friction or cohesion) were further evaluated and limited to the maximum allowable total and effective soil shear strength in accordance with 2010 SCDOT GDM, Tables 7-15 and 7-16, respectively, unless laboratory shear strength data was available. The majority of the SPT blow counts, $N^*_{1,60}$, for cohesionless soils substantially exceeded a corrected blow count of 16.6 blows/foot which corresponds to an effective internal angle of friction, ϕ', of 36 degrees and consequently may be a lower bound value that has been limited to the maximum allowable internal angle of friction (typically 36 degrees). The corrected SPT blow counts, N_{60}, $N^*_{1,60}$, $N^*_{1,60,CS}$, and soil shear strength correlations for SPT soil borings are included in this appendix.

SEISMIC SOIL SHEAR STRENGTH

Seismic soil shear strength parameters of the subsurface soils were evaluated by first screening the SPT soil borings to determine if the soils encountered are susceptible to soil shear strength loss (SSL). Soils identified as susceptible to soil SSL were then evaluated to determine if the seismic demand (SEE) was capable of triggering soil SSL.

Soil borings were screened for soil SSL susceptibility based on classification of the soils as either No Strength Loss (NSL) or Possible Strength Loss (PSL). PSL soils were further classified as either Sand-Like, NS Clay-Like soils, or HS Clay-Like soils. The soil SSL screening for Sand-Like, NS Clay-Like soils, and HS Clay-Like soils was based on fines content corrected SPT blow counts, $N^*_{1,60,CS}$, Fines Content (FC), Plasticity Index (PI), USCS soil classification, and depth to ground water table in accordance with the GDM Subsection 13.6.

Sand-Like, NS Clay-Like soils, and HS Clay-Like soils were then evaluated to determine if the seismic demand (SEE) would trigger soil SSL. Soil SSL triggering was evaluated using seismic design parameters from Section 4 and the SSL triggering method for level ground sites in accordance with GDM Subsection 13.7. Sand-like soils were assigned liquefaction resistance age correction factors (K_{DR}) based on the Shear Wave Velocity Evaluation. Sand-Like soils that indicate triggering of soil SSL will undergo full or limited cyclic liquefaction and NS/HS Clay-Like soils that indicate triggering of soil SSL will undergo cyclic softening. The SSL screening, triggering, and seismic soil shear strengths for the borings listed below are provided in this appendix.

SEISMIC HAZARD EVALUATION

Seismic settlements were evaluated using the procedures outlined by Idriss and Boulanger in the 2008 EERI Monograph MNO-12, "Soil Liquefaction during Earthquakes." The results of the seismic settlement evaluation are included in this appendix.

Included in this appendix are analyses for the following borings:

- RW-1
- RW-2
- RW-3
- RW-3B
- B-1
- B-1A
- B-2
- B-3
- B-3A
- B-4
- B-5
- B-5A
- B-6
- B-6A
- B-7
- B-7A
- B-8
- B-9
- RW-4
- RW-5
- RW-6
- RW-7

SPT-Based Soil Shear Strength Loss Evaluation

ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D			
Design Earthquake:	**SEE**	**FEE**		
S_{D1} =	**0.490**	**0.180**	g	
k_{max} = **PGA =**	**0.430**	**0.200**	g	
β = S_{D1}/PGA =	1.140	0.900		β = Ground Motion Index: $0.50 \le \beta \le 1.5$
α_w =	1.000	1.000		α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20$ft $\alpha_w = 1.0$
$k_h = k_{avg}$ =	0.430	0.200	g	k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$
M_w =	**7.37**	**7.36**		M_w = Moment Magnitude of Design Earthquake; M_w & R = Deaggregation Analysis
R =	**63.5**	**64.2**	km	R = Site-to-Source Distance
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec	$\bar{V}_s$ = Average Shear Wave Velocity; $\bar{V}_s$ from Three-Point Method Excel Spreadsheet
Z_{HR} =	**494.5**	**494.5**	meters	Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output
ε =	0.000	0.000		ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0
$D_{a5\text{-}95}$	30.15	30.09	sec	$D_{a5\text{-}95}$ = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0002	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D			
Design Earthquake:	**SEE**	**FEE**		
S_{D1} =	**0.490**	**0.180**	g	
k_{max} = **PGA =**	**0.430**	**0.200**	g	
β = S_{D1}/PGA =	1.140	0.900		β = Ground Motion Index: — $0.50 \le \beta \le 1.5$
α_w =	1.000	1.000		α_w = Wave Scattering Scaling Factor: — $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20$ft $\alpha_w = 1.0$
$k_h = k_{avg}$ =	0.430	0.200	g	k_h = Average seismic horizontal coefficient due to wave scattering: — $k_h = k_{avg} = \alpha_w k_{max}$
M_w =	**7.37**	**7.36**		M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis
R =	**63.5**	**64.2**	km	R = Site-to-Source Distance
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec	$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet
Z_{HR} =	**494.5**	**494.5**	meters	Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output
ε =	0.000	0.000		ε = Near-fault directivity correction: — R < 20 km; ε = 0.015(R-20)
$D_{a5\text{-}95}$	30.15	30.09	sec	$D_{a5\text{-}95}$ = Duration of Earthquake as a function of acceleration: Use Eq. 12-48 — R ≥ 20 km; ε = 0

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0001-0002	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D			
Design Earthquake:	**SEE**	**FEE**		
S_{D1} =	**0.490**	**0.180**	g	
k_{max} = **PGA =**	**0.430**	**0.200**	g	
β = S_{D1}/PGA =	1.140	0.900		β = Ground Motion Index: — $0.50 \le \beta \le 1.5$
α_w =	1.000	1.000		α_w = Wave Scattering Scaling Factor: — $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20$ft $\alpha_w = 1.0$
$k_h = k_{avg}$ =	0.430	0.200	g	k_h = Average seismic horizontal coefficient due to wave scattering: — $k_h = k_{avg} = \alpha_w k_{max}$
M_w =	**7.37**	**7.36**		M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis
R =	**63.5**	**64.2**	km	R = Site-to-Source Distance
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec	$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet
Z_{HR} =	**494.5**	**494.5**	meters	Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output
ε =	0.000	0.000		ε = Near-fault directivity correction: — R < 20 km; ε = 0.015(R-20)
$D_{a5\text{-}95}$	30.15	30.09	sec	$D_{a5\text{-}95}$ = Duration of Earthquake as a function of acceleration: Use Eq. 12-48 — R ≥ 20 km; ε = 0

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D			
Design Earthquake:	**SEE**	**FEE**		
S_{D1} =	**0.490**	**0.180**	g	
k_{max} = **PGA =**	**0.430**	**0.200**	g	
β = S_{D1}/PGA =	1.140	0.900		β = Ground Motion Index: — $0.50 \le \beta \le 1.5$
α_w =	1.000	1.000		α_w = Wave Scattering Scaling Factor: — $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20$ft $\alpha_w = 1.0$
$k_h = k_{avg}$ =	0.430	0.200	g	$\mathbf{k}_h$ = Average seismic horizontal coefficient due to wave scattering: — $k_h = k_{avg} = \alpha_w k_{max}$
M_w =	**7.37**	**7.36**		M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis
R =	**63.5**	**64.2**	km	R = Site-to-Source Distance
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec	$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet
Z_{HR} =	**494.5**	**494.5**	meters	Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output
ε =	0.000	0.000		ε = Near-fault directivity correction: — R < 20 km; ε = 0.015(R-20)
$D_{a5\text{-}95}$	30.15	30.09	sec	$D_{a5\text{-}95}$ = Duration of Earthquake as a function of acceleration: Use Eq. 12-48 — R ≥ 20 km; ε = 0

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457470000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.648210000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D			
Design Earthquake:	**SEE**	**FEE**		
S_{D1} =	**0.490**	**0.180**	g	
k_{max} = **PGA =**	**0.430**	**0.200**	g	
β = S_{D1}/PGA =	1.140	0.900		β = Ground Motion Index: — $0.50 \le \beta \le 1.5$
α_w =	1.000	1.000		α_w = Wave Scattering Scaling Factor: — $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20$ft $\alpha_w = 1.0$
$k_h = k_{avg}$ =	0.430	0.200	g	k_h = Average seismic horizontal coefficient due to wave scattering: — $k_h = k_{avg} = \alpha_w k_{max}$
M_w =	**7.37**	**7.36**		M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis
R =	**63.5**	**64.2**	km	R = Site-to-Source Distance
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec	$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet
Z_{HR} =	**494.5**	**494.5**	meters	Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output
ε =	0.000	0.000		ε = Near-fault directivity correction: — R < 20 km; ε = 0.015(R-20)
$D_{a5\text{-}95}$	30.15	30.09	sec	$D_{a5\text{-}95}$ = Duration of Earthquake as a function of acceleration: Use Eq. 12-48 — R ≥ 20 km; ε = 0

SPT-Based Soil Shear Strength Loss Evaluation

Idriss and Boulanger Procedure (2008) - GeoStellar Engineering v2.5.8 - 20160315

GSE No.:	41503-0002-0001	**File No.:**		**Latitude:**	33.457000000	**Designer:**	G. Burnworth - GSE
Route:	US 301	**County:**	38 - Orangeburg	**Longitude:**	-80.647000000	**Date:**	3/9/2016
Project:	RBO Four Hole Swamp						
Location:						**Finished Embankment Height (ft)[1] =**	

[1]Embankment height measured from natural ground surface

Bridge & Roadway Information:

OC =	II
ROC =	II

Seismic Data:

Site Class =	D		
Design Earthquake:	**SEE**	**FEE**	
S_{D1} =	**0.490**	**0.180**	g
k_{max} = **PGA =**	**0.430**	**0.200**	g
β = S_{D1}/PGA =	1.140	0.900	
α_w =	1.000	1.000	
$k_h = k_{avg}$ =	0.430	0.200	g
M_w =	**7.37**	**7.36**	
R =	**63.5**	**64.2**	km
$\bar{V}_s$ =	**1005.4**	**1005.4**	ft/sec
Z_{HR} =	**494.5**	**494.5**	meters
ε =	0.000	0.000	
D_{a5-95}	30.15	30.09	sec

β = Ground Motion Index: $0.50 \le \beta \le 1.5$

α_w = Wave Scattering Scaling Factor: $1+0.01h_{slope}[(0.5\beta)-1] \le 1.0$: for $h_{slope} \le 20ft$ $\alpha_w = 1.0$

k_h = Average seismic horizontal coefficient due to wave scattering: $k_h = k_{avg} = \alpha_w k_{max}$

M_w = Moment Magnitude of Design Earthquake — M_w & R = Deaggregation Analysis

R = Site-to-Source Distance

$\bar{V}_s$ = Average Shear Wave Velocity — $\bar{V}_s$ from Three-Point Method Excel Spreadsheet

Z_{HR} = Depth from ground surface to hard rock V_s > 5,000 ft/sec; from SCENARIO_PC 2006 output

ε = Near-fault directivity correction: R < 20 km; ε = 0.015(R-20); R ≥ 20 km; ε = 0

D_{a5-95} = Duration of Earthquake as a function of acceleration: Use Eq. 12-48

APPENDIX C

AXIAL COMPRESSION PILE CAPACITY ANALYSES

GeoStellar Engineering

APPENDIX C
AXIAL PILE COMPRESSION CAPACITY ANALYSES

Pile capacity analyses were performed using APILE version 2014 with the option for FHWA design methodology. Axial pile compression capacity charts vs. depth have been developed for the Strength limit state. Axial pile capacity analyses for determining the required pile capacity for pile capacity verification were also performed. The APILE soil model input properties for the piles at Bent 3 are shown in the following tables. Table C1 shows soil model input properties for the Service limit state and Table C2 shows properties for the Strength limit state.

Table C1. APILE – Service Limit State Soil Input Properties for Bent 3 Piles

Layer	Soil Type	Depth[1] Below Ground Surface (ft)	Depth[1] Below Top of Pile (ft)	Effective Unit Weight (pcf)	Friction Angle (degrees)	Cohesion (psf)
1	Sand	0 – 10	10 – 20	52.6	32	---[2]
2	Sand	10 – 57	20 – 67	57.6	36	---[2]
3	Sand	57 – 80	67 – 90	22 / 57.6 [3]	24 / 36 [3]	---[2]
4	Sand	80 - 102	90 - 112	57.6	36	---[2]
5	Sand	102 - 200	112 - 210	57.6	36	---[2]

[1] Assumed Pile Head Elevation 120 ft-msl; Ground Surface Elev. 110 ft-msl
[2] Not applicable input for selected soil type
[3] Weak Soil Zone Encountered / Weak Soil Zone not Encountered

Table C2. APILE – Strength Limit State Soil Input Properties for Bent 3 Piles

Layer	Soil Type	Depth[1] Below Ground Surface (ft)	Depth[1] Below Top of Pile (ft)	Effective Unit Weight (pcf)	Friction Angle (degrees)	Cohesion (psf)
1	Sand	0 – 30	33 – 63	57.6	36	---[2]
2	Sand	30 – 53	63 – 86	22 / 57.6 [3]	24 / 36 [3]	---[2]
3	Sand	53 – 75	86 – 108	57.6	36	---[2]
4	Sand	75 - 200	108 - 233	57.6	36	---[2]

[1] Assumed Pile Head Elevation 116 ft-msl; Ground Surface Elev. after scour event 83 ft-msl
[2] Not applicable input for selected soil type
[3] Weak Soil Zone Encountered / Weak Soil Zone not Encountered

The following axial pile compression capacity analyses have been included in this appendix:

- Bent 3 Strength Limit State Axial Pile Capacity Analysis – Weak Soil Zone Encountered
- Bent 3 Strength Limit State Axial Pile Capacity Analysis – No Weak Soil Zone Encountered

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 143.00 FT.
- PILE STICKUP LENGTH, PSL = 6.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 143.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Plugged for open-ended pile

      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 143.00 FT.
- PILE STICKUP LENGTH, PSL = 6.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 143.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Unplugged for open-ended pile

SOIL INFORMATIONS :

      * INPUT INFORMATION *
      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 108.00 FT.
- PILE STICKUP LENGTH, PSL = 10.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 108.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Unplugged for open-ended pile

      **********************
      * INPUT INFORMATION *
      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 143.00 FT.
- PILE STICKUP LENGTH, PSL = 33.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 143.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Unplugged for open-ended pile

SOIL INFORMATIONS :

      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

```
DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY     = 0.300E+08 PSI
- CROSS SECTION AREA        =    219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD      =     48.00 IN.
- INTERNAL DIAMETER, ID     =     45.00 IN.
- TOTAL PILE LENGTH, TL     =    143.00 FT.
- PILE STICKUP LENGTH, PSL  =      6.00 FT.
- ZERO FRICTION LENGTH, ZFL =      0.00 FT.
- INCREMENT OF PILE LENGTH
  USED IN COMPUTATION       =      1.00 FT.
- LENGTH OF ENHANCED
  END SECTION               =    143.00 FT.
- INTERNAL DIAMETER OF
  ENHANCED END SECTION      =     45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Plugged for open-ended pile

      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 143.00 FT.
- PILE STICKUP LENGTH, PSL = 6.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 143.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Unplugged for open-ended pile

      * INPUT INFORMATION *
      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 121.00 FT.
- PILE STICKUP LENGTH, PSL = 10.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 121.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Unplugged for open-ended pile

      * INPUT INFORMATION *
      **********************

      US 301 RBO Four Hole Swamp: 48"OEP (1.5"t) weak zone, unplugged

      DESIGNER   : Gabriel Burnworth

      JOB NUMBER : 41503-0002-0001

      METHOD FOR UNIT LOAD TRANSFERS :

      - FHWA (Federal Highway Administration)
        Unfactored Unit Side Friction and Unit Side Resistance are used.

      COMPUTATION METHOD(S) FOR PILE CAPACITY :

      - FHWA (Federal Highway Administration)

      TYPE OF LOADING :
      - COMPRESSION

      PILE TYPE :

      Steel pipe pile or non-tapered portion of monotube pile
```

DATA FOR AXIAL STIFFNESS :

- MODULUS OF ELASTICITY = 0.300E+08 PSI
- CROSS SECTION AREA = 219.13 IN2

CIRCULAR PILE PROPERTIES :

- OUTSIDE DIAMETER, OD = 48.00 IN.
- INTERNAL DIAMETER, ID = 45.00 IN.
- TOTAL PILE LENGTH, TL = 143.00 FT.
- PILE STICKUP LENGTH, PSL = 33.00 FT.
- ZERO FRICTION LENGTH, ZFL = 0.00 FT.
- INCREMENT OF PILE LENGTH USED IN COMPUTATION = 1.00 FT.
- LENGTH OF ENHANCED END SECTION = 143.00 FT.
- INTERNAL DIAMETER OF ENHANCED END SECTION = 45.00 IN.

PLUGGED/UNPLUGGED CONDITIONS :
Unplugged for open-ended pile

APPENDIX D

LATERAL PILE RESPONSE

GeoStellar Engineering

APPENDIX D
LATERAL PILE RESPONSE

The top of the pile lateral response has been evaluated by specifying several displacements and then solving for the pile top shear load required to produce the displacement specified. The pile top boundary condition used for interior bent piles is "fixed head" and "free head". The fixed head boundary conditions is defined by LPILE Load Type 5 (Pile Top Boundary Condition): Load 1 = Pile Head Displacement, inches, and Load 2 = Pile Head Rotation = 0 radians. The free head boundary conditions is defined by LPILE Load Type 4 (Pile Top Boundary Condition): Load 1 = Pile Head Displacement, inches, and Load 2 = Pile Head Moment = 0 in-lbs. The LPILE soil model input properties for the piles at Bent 3 and Bent 4 are shown in Table D1 and Table D2, respectively.

Table D1. LPILE – Service Limit State Soil Input Properties for Bent 3 Piles

Layer	Soil Type	Depth[1] Below Top of Pile (ft)	Effective Unit Weight (pcf)	Friction Angle (degrees)	Cohesion (psf)	p-y Modulus (pci)	Strain Factor
1	Sand (Reese)	33 – 63	57.6	36	---[2]	default	---[2]
2	Sand (Reese)	63 – 86	22 / 57.6 [3]	24 / 36	---[2]	default	---[2]
3	Sand (Reese)	86 - 108	57.6	36	---[2]	default	---[2]
4	Sand (Reese)	108 - 206	57.6	36	---[2]	default	---[2]

[1] Assumed Pile Head Elevation 116 ft-msl; Ground Surface Elev. after scour event 83 ft-msl
[2] Not applicable input for selected soil type
[3] Weak Soil Zone Encountered / Weak Soil Zone not Encountered

Table D2. LPILE – Service Limit State Soil Input Properties for Bent 4 Piles

Layer	Soil Type	Depth[1] Below Top of Pile (ft)	Effective Unit Weight (pcf)	Friction Angle (degrees)	Cohesion (psf)	p-y Modulus (pci)	Strain Factor
1	Sand (Reese)	21 – 63	57.6	36	---[2]	default	---[2]
2	Sand (Reese)	63 – 86	22 / 57.6 [3]	24 / 36	---[2]	default	---[2]
3	Sand (Reese)	86 - 108	57.6	36	---[2]	default	---[2]
4	Sand (Reese)	108 - 206	57.6	36	---[2]	default	---[2]

[1] Assumed Pile Head Elevation 116 ft-msl; Ground Surface Elev. after scour event 94 ft-msl
[2] Not applicable input for selected soil type
[3] Weak Soil Zone Encountered / Weak Soil Zone not Encountered

The following lateral pile responses LPILE analyses have been performed and are included in this appendix.

- Interior Bent – Service Limit State – Deep Scour, Weak Soil Zone Encountered
- Interior Bent – Service Limit State – Deep Scour, No Weak Soil Zone Encountered
- Interior Bent – Service Limit State – Shallow Scour, Weak Soil Zone Encountered
- Interior Bent – Service Limit State – Shallow Scour, No Weak Soil Zone Encountered

Bent 3 – Service Limit State
LPILE Analyses

--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) Weak Zone, 83' scour elev., Free Head

--------------------------------------------------------------------------------
                          Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

- Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed = 500
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in
- Number of pile increments = 100

Loading Type and Number of Cycles of Loading:
- Static loading specified

Computational Options:
- Use unfactored loads in computations (conventional analysis)
- Compute pile response under loading and nonlinear bending properties of pile (only if nonlinear pile properties are input)
- Use of p-y modification factors for p-y curves not selected
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- No p-y curves to be computed and reported for user-specified depths
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total number of pile sections = 1

Total length of pile = 150.00 ft

Depth of ground surface below top of pile = 33.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	48.0000000
2	150.000000	48.0000000

Input Structural Properties:

Pile Section No. 1:

Section Type = Steel Pipe Pile
Section Length = 150.00000 ft
Pile Diameter = 48.00000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 0.000 degrees
= 0.000 radians

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

--------------------------------------------------------------------------------
                      Soil and Rock Layering Information
--------------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     33.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

--------------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	33.000	57.600	36.000	default
		63.000	57.600	36.000	default
2	Sand (Reese, et al.)	63.000	57.600	36.000	default
		86.000	57.600	36.000	default
3	Sand (Reese, et al.)	86.000	57.600	36.000	default
		108.000	57.600	36.000	default
4	Sand (Reese, et al.)	108.000	57.600	36.000	default
		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	4	y = 0.12500 in	M = 0.0000 in-lbs	552000.	No
2	4	y = 0.25000 in	M = 0.0000 in-lbs	552000.	No
3	4	y = 0.50000 in	M = 0.0000 in-lbs	552000.	No
4	4	y = 1.00000 in	M = 0.0000 in-lbs	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

Moment of Inertia = 59287. in^4
Elastic Bending Stiffness = 1.7193E+09 kip-in^2
Plastic Modulus, Z = 3244.50000 in^3
Plastic Moment Capacity = Fy Z = 116802. in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 7888.539 kips
Nominal Axial Tensile Capacity = -7888.539 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	552.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 552.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Total Stress ksi	Run Msg

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.125000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =     -0.0003108 radians
Maximum bending moment           =       1329202. inch-lbs
Maximum shear force              =  -6014.9952521 lbs
Depth of maximum bending moment  =     39.0000000 feet below pile head
Depth of maximum shear force     =     51.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.250000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection              =      0.2500000 inches
Computed slope at pile head       =     -0.0006217 radians
Maximum bending moment            =       2658405. inch-lbs
Maximum shear force               =        -12030. lbs
Depth of maximum bending moment   =     39.0000000 feet below pile head
Depth of maximum shear force      =     51.0000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.500000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection              =      0.5000000 inches
Computed slope at pile head       =     -0.0012433 radians
Maximum bending moment            =       5316809. inch-lbs
Maximum shear force               =        -24060. lbs
Depth of maximum bending moment   =     39.0000000 feet below pile head
Depth of maximum shear force      =     51.0000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 1.000000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0024743 radians
Maximum bending moment           =      10571801. inch-lbs
Maximum shear force              =        -48055. lbs
Depth of maximum bending moment  =     39.0000000 feet below pile head
Depth of maximum shear force     =     51.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	4	y = 0.1250	M = 0.000	552000.	0.12500000	1329202.	-6014.9953	-0.00031083
2	4	y = 0.2500	M = 0.000	552000.	0.25000000	2658405.	-12030.	-0.00062166
3	4	y = 0.5000	M = 0.000	552000.	0.50000000	5316809.	-24060.	-0.00124333
4	4	y = 1.0000	M = 0.000	552000.	1.00000000	10571801.	-48055.	-0.00247427

                          Date and Time of Analysis
--------------------------------------------------------------------------------

               Date:  March 2, 2016     Time:  16:48:18

--------------------------------------------------------------------------------
                                Problem Title
--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) Weak Zone, 83' scour elev., Fixed Head

--------------------------------------------------------------------------------
                          Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

```
 - Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed                =          500
- Deflection tolerance for convergence                =   1.0000E-05 in
- Maximum allowable deflection                        =     100.0000 in
- Number of pile increments                           =          100

Loading Type and Number of Cycles of Loading:
 - Static loading specified

Computational Options:
 - Use unfactored loads in computations (conventional analysis)
 - Compute pile response under loading and nonlinear bending properties of pile
   (only if nonlinear pile properties are input)
 - Use of p-y modification factors for p-y curves not selected
 - Loading by lateral soil movements acting on pile not selected
 - Input of shear resistance at the pile tip not selected
 - Computation of pile-head foundation stiffness matrix not selected
 - Push-over analysis of pile not selected
 - Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

---------------------------------------------------------------------------
                    Pile Structural Properties and Geometry
---------------------------------------------------------------------------

Total number of pile sections                        =         1

Total length of pile                                 =     150.00 ft

Depth of ground surface below top of pile            =      33.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point         Depth              Pile
                X              Diameter
                ft                in
-----       ---------        -----------
  1          0.00000         48.0000000
  2        150.000000        48.0000000

Input Structural Properties:
----------------------------

Pile Section No. 1:

   Section Type                                      = Steel Pipe Pile
   Section Length                                    =    150.00000 ft
   Pile Diameter                                     =     48.00000 in

---------------------------------------------------------------------------
                      Ground Slope and Pile Batter Angles
---------------------------------------------------------------------------

Ground Slope Angle                                   =        0.000 degrees
                                                     =        0.000 radians
```

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	33.00000 ft
Distance from top of pile to bottom of layer	=	63.00000 ft
Effective unit weight at top of layer	=	57.60000 pcf
Effective unit weight at bottom of layer	=	57.60000 pcf
Friction angle at top of layer	=	36.00000 deg.
Friction angle at bottom of layer	=	36.00000 deg.
Subgrade k at top of layer	=	0.0000 pci
Subgrade k at bottom of layer	=	0.0000 pci

NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	63.00000 ft
Distance from top of pile to bottom of layer	=	86.00000 ft
Effective unit weight at top of layer	=	57.60000 pcf
Effective unit weight at bottom of layer	=	57.60000 pcf
Friction angle at top of layer	=	36.00000 deg.
Friction angle at bottom of layer	=	36.00000 deg.
Subgrade k at top of layer	=	0.0000 pci
Subgrade k at bottom of layer	=	0.0000 pci

NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	86.00000 ft
Distance from top of pile to bottom of layer	=	108.00000 ft
Effective unit weight at top of layer	=	57.60000 pcf
Effective unit weight at bottom of layer	=	57.60000 pcf
Friction angle at top of layer	=	36.00000 deg.
Friction angle at bottom of layer	=	36.00000 deg.
Subgrade k at top of layer	=	0.0000 pci
Subgrade k at bottom of layer	=	0.0000 pci

NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	108.00000 ft
Distance from top of pile to bottom of layer	=	206.00000 ft
Effective unit weight at top of layer	=	57.60000 pcf
Effective unit weight at bottom of layer	=	57.60000 pcf
Friction angle at top of layer	=	36.00000 deg.
Friction angle at bottom of layer	=	36.00000 deg.
Subgrade k at top of layer	=	0.0000 pci
Subgrade k at bottom of layer	=	0.0000 pci

NOTE: Internal default values for subgrade k will be computed for this soil layer.

(Depth of lowest soil layer extends 56.00 ft below pile tip)

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	33.000	57.600	36.000	default
		63.000	57.600	36.000	default
2	Sand (Reese, et al.)	63.000	57.600	36.000	default
		86.000	57.600	36.000	default
3	Sand (Reese, et al.)	86.000	57.600	36.000	default
		108.000	57.600	36.000	default
4	Sand (Reese, et al.)	108.000	57.600	36.000	default
		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	5	y = 0.12500 in	S = 0.0000 in/in	552000.	No
2	5	y = 0.25000 in	S = 0.0000 in/in	552000.	No
3	5	y = 0.50000 in	S = 0.0000 in/in	552000.	No
4	5	y = 1.00000 in	S = 0.0000 in/in	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

Moment of Inertia = 59287. in^4
Elastic Bending Stiffness = 1.7193E+09 kip-in^2
Plastic Modulus, Z = 3244.50000 in^3
Plastic Moment Capacity = Fy Z = 116802. in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 7888.539 kips
Nominal Axial Tensile Capacity = -7888.539 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	552.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 552.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Total Stress ksi	Run Msg

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.125000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
Values of total stress due to combined axial and bending stresses are computed only
for elastic sections only and do not equal the actual stresses in concrete and steel.
Stresses in concrete and steel may be interpolated from the output for nonlinear
bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =   -0.000001082 radians
Maximum bending moment           =      -3455698. inch-lbs
Maximum shear force              =         11472. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.250000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection              =      0.2500000 inches
Computed slope at pile head       =   -0.000002164 radians
Maximum bending moment            =      -6911397. inch-lbs
Maximum shear force               =         22944. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =       0.000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.500000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection              =      0.5000000 inches
Computed slope at pile head       =   -0.000004274 radians
Maximum bending moment            =     -13716161. inch-lbs
Maximum shear force               =         45325. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =       0.000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 1.000000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =   -0.000007811 radians
Maximum bending moment           =     -25817896. inch-lbs
Maximum shear force              =         82824. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =     18.0000000 feet below pile head
Number of iterations             =             10
Number of zero deflection points =              5
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	5	y = 0.1250	S = 0.000	552000.	0.12500000	-3455698.	11472.	-0.00000108
2	5	y = 0.2500	S = 0.000	552000.	0.25000000	-6911397.	22944.	-0.00000216
3	5	y = 0.5000	S = 0.000	552000.	0.50000000	-13716161.	45325.	-0.00000427
4	5	y = 1.0000	S = 0.000	552000.	1.00000000	-25817896.	82824.	-0.00000781

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) Weak Zone, 83' scour elev., Free Head

--------------------------------------------------------------------------------
                          Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

```
 - Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed                =          500
- Deflection tolerance for convergence                =   1.0000E-05 in
- Maximum allowable deflection                        =     100.0000 in
- Number of pile increments                           =          100

Loading Type and Number of Cycles of Loading:
 - Static loading specified

Computational Options:
 - Use unfactored loads in computations (conventional analysis)
 - Compute pile response under loading and nonlinear bending properties of pile
   (only if nonlinear pile properties are input)
 - Use of p-y modification factors for p-y curves not selected
 - Loading by lateral soil movements acting on pile not selected
 - Input of shear resistance at the pile tip not selected
 - Computation of pile-head foundation stiffness matrix not selected
 - Push-over analysis of pile not selected
 - Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

---------------------------------------------------------------------------
                    Pile Structural Properties and Geometry
---------------------------------------------------------------------------

Total number of pile sections                        =         1

Total length of pile                                 =     150.00 ft

Depth of ground surface below top of pile            =      33.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point         Depth              Pile
                X              Diameter
                ft                in
-----       ---------        -----------
  1          0.00000         48.0000000
  2        150.000000        48.0000000

Input Structural Properties:
----------------------------

Pile Section No. 1:

   Section Type                                      = Steel Pipe Pile
   Section Length                                    =    150.00000 ft
   Pile Diameter                                     =     48.00000 in

---------------------------------------------------------------------------
                      Ground Slope and Pile Batter Angles
---------------------------------------------------------------------------

Ground Slope Angle                                   =        0.000 degrees
                                                     =        0.000 radians
```

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

---------------------------------------------------------------------------
                      Soil and Rock Layering Information
---------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     33.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     22.00000 pcf
   Effective unit weight at bottom of layer         =     22.00000 pcf
   Friction angle at top of layer                   =     24.00000 deg.
   Friction angle at bottom of layer                =     24.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

---------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	33.000	57.600	36.000	default
		63.000	57.600	36.000	default
2	Sand (Reese, et al.)	63.000	22.000	24.000	default
		86.000	22.000	24.000	default
3	Sand (Reese, et al.)	86.000	57.600	36.000	default
		108.000	57.600	36.000	default
4	Sand (Reese, et al.)	108.000	57.600	36.000	default
		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	4	y = 0.12500 in	M = 0.0000 in-lbs	552000.	No
2	4	y = 0.25000 in	M = 0.0000 in-lbs	552000.	No
3	4	y = 0.50000 in	M = 0.0000 in-lbs	552000.	No
4	4	y = 1.00000 in	M = 0.0000 in-lbs	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

```
Moment of Inertia                                  =       59287. in^4

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.125000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =     -0.0003100 radians
Maximum bending moment           =       1315953. inch-lbs
Maximum shear force              =  -6063.6307528 lbs
Depth of maximum bending moment  =     39.0000000 feet below pile head
Depth of maximum shear force     =     51.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.250000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection              =      0.2500000 inches
Computed slope at pile head       =     -0.0006200 radians
Maximum bending moment            =       2631906. inch-lbs
Maximum shear force               =        -12127. lbs
Depth of maximum bending moment   =     39.0000000 feet below pile head
Depth of maximum shear force      =     51.0000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.500000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection              =      0.5000000 inches
Computed slope at pile head       =     -0.0012401 radians
Maximum bending moment            =       5263813. inch-lbs
Maximum shear force               =        -24255. lbs
Depth of maximum bending moment   =     39.0000000 feet below pile head
Depth of maximum shear force      =     51.0000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 1.000000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0024670 radians
Maximum bending moment           =      10459624. inch-lbs
Maximum shear force              =        -48454. lbs
Depth of maximum bending moment  =     39.0000000 feet below pile head
Depth of maximum shear force     =     51.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              4
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	4	y = 0.1250	M = 0.000	552000.	0.12500000	1315953.	-6063.6308	-0.00031002
2	4	y = 0.2500	M = 0.000	552000.	0.25000000	2631906.	-12127.	-0.00062004
3	4	y = 0.5000	M = 0.000	552000.	0.50000000	5263813.	-24255.	-0.00124009
4	4	y = 1.0000	M = 0.000	552000.	1.00000000	10459624.	-48454.	-0.00246703

                                Problem Title
--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) Weak Zone, 83' scour elev., Fixed Head

--------------------------------------------------------------------------------
                          Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

```
 - Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed                =          500
- Deflection tolerance for convergence                =   1.0000E-05 in
- Maximum allowable deflection                        =     100.0000 in
- Number of pile increments                           =          100

Loading Type and Number of Cycles of Loading:
 - Static loading specified

Computational Options:
 - Use unfactored loads in computations (conventional analysis)
 - Compute pile response under loading and nonlinear bending properties of pile
   (only if nonlinear pile properties are input)
 - Use of p-y modification factors for p-y curves not selected
 - Loading by lateral soil movements acting on pile not selected
 - Input of shear resistance at the pile tip not selected
 - Computation of pile-head foundation stiffness matrix not selected
 - Push-over analysis of pile not selected
 - Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

---------------------------------------------------------------------------
                    Pile Structural Properties and Geometry
---------------------------------------------------------------------------

Total number of pile sections                        =       1

Total length of pile                                 =     150.00 ft

Depth of ground surface below top of pile            =      33.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point         Depth              Pile
                X              Diameter
                ft                in
-----       ---------        -----------
  1          0.00000         48.0000000
  2        150.000000        48.0000000

Input Structural Properties:
----------------------------

Pile Section No. 1:

   Section Type                                      = Steel Pipe Pile
   Section Length                                    =    150.00000 ft
   Pile Diameter                                     =     48.00000 in

---------------------------------------------------------------------------
                      Ground Slope and Pile Batter Angles
---------------------------------------------------------------------------

Ground Slope Angle                                   =        0.000 degrees
                                                     =        0.000 radians
```

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

--------------------------------------------------------------------------------
                      Soil and Rock Layering Information
--------------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     33.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     22.00000 pcf
   Effective unit weight at bottom of layer         =     22.00000 pcf
   Friction angle at top of layer                   =     24.00000 deg.
   Friction angle at bottom of layer                =     24.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

--------------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	33.000	57.600	36.000	default
		63.000	57.600	36.000	default
2	Sand (Reese, et al.)	63.000	22.000	24.000	default
		86.000	22.000	24.000	default
3	Sand (Reese, et al.)	86.000	57.600	36.000	default
		108.000	57.600	36.000	default
4	Sand (Reese, et al.)	108.000	57.600	36.000	default
		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	5	y = 0.12500 in	S = 0.0000 in/in	552000.	No
2	5	y = 0.25000 in	S = 0.0000 in/in	552000.	No
3	5	y = 0.50000 in	S = 0.0000 in/in	552000.	No
4	5	y = 1.00000 in	S = 0.0000 in/in	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

```
Moment of Inertia                                  =       59287. in^4
Elastic Bending Stiffness                          =   1.7193E+09 kip-in^2
Plastic Modulus, Z                                 =   3244.50000 in^3
Plastic Moment Capacity = Fy Z                     =      116802. in-kip

Axial Structural Capacities:
----------------------------

Nom. Axial Structural Capacity = Fy As             =     7888.539 kips
Nominal Axial Tensile Capacity                     =    -7888.539 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.125000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =   -0.000001073 radians
Maximum bending moment           =      -3438884. inch-lbs
Maximum shear force              =         11381. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =     33.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.250000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
Values of total stress due to combined axial and bending stresses are computed only
for elastic sections only and do not equal the actual stresses in concrete and steel.
Stresses in concrete and steel may be interpolated from the output for nonlinear
bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =   -0.000002147 radians
Maximum bending moment           =      -6877767. inch-lbs
Maximum shear force              =         22763. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =     16.5000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.500000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection              =      0.5000000 inches
Computed slope at pile head       =   -0.000004237 radians
Maximum bending moment            =     -13643152. inch-lbs
Maximum shear force               =         44933. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =     28.5000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 1.000000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =   -0.000007720 radians
Maximum bending moment           =     -25636535. inch-lbs
Maximum shear force              =         81864. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =     27.0000000 feet below pile head
Number of iterations             =             10
Number of zero deflection points =              4
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	5	y = 0.1250	S = 0.000	552000.	0.12500000	-3438884.	11381.	-0.00000107

                                Problem Title
--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) No Weak Zone, 94' scour elev., Free

--------------------------------------------------------------------------------
                          Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

```
 - Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed                =          500
- Deflection tolerance for convergence                =   1.0000E-05 in
- Maximum allowable deflection                        =     100.0000 in
- Number of pile increments                           =          100

Loading Type and Number of Cycles of Loading:
 - Static loading specified

Computational Options:
 - Use unfactored loads in computations (conventional analysis)
 - Compute pile response under loading and nonlinear bending properties of pile
   (only if nonlinear pile properties are input)
 - Use of p-y modification factors for p-y curves not selected
 - Loading by lateral soil movements acting on pile not selected
 - Input of shear resistance at the pile tip not selected
 - Computation of pile-head foundation stiffness matrix not selected
 - Push-over analysis of pile not selected
 - Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

---------------------------------------------------------------------------
                    Pile Structural Properties and Geometry
---------------------------------------------------------------------------

Total number of pile sections                        =        1

Total length of pile                                 =     150.00 ft

Depth of ground surface below top of pile            =      21.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point         Depth              Pile
                X              Diameter
                ft                in
-----       ---------        -----------
  1          0.00000         48.0000000
  2        150.000000        48.0000000

Input Structural Properties:
----------------------------

Pile Section No. 1:

   Section Type                                      = Steel Pipe Pile
   Section Length                                    =    150.00000 ft
   Pile Diameter                                     =     48.00000 in

---------------------------------------------------------------------------
                      Ground Slope and Pile Batter Angles
---------------------------------------------------------------------------

Ground Slope Angle                                   =        0.000 degrees
                                                     =        0.000 radians
```

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

--------------------------------------------------------------------------------
                      Soil and Rock Layering Information
--------------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     21.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

--------------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci

		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	4	y = 0.12500 in	M = 0.0000 in-lbs	552000.	No
2	4	y = 0.25000 in	M = 0.0000 in-lbs	552000.	No
3	4	y = 0.50000 in	M = 0.0000 in-lbs	552000.	No
4	4	y = 1.00000 in	M = 0.0000 in-lbs	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

Moment of Inertia = 59287. in^4
Elastic Bending Stiffness = 1.7193E+09 kip-in^2
Plastic Modulus, Z = 3244.50000 in^3
Plastic Moment Capacity = Fy Z = 116802. in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 7888.539 kips
Nominal Axial Tensile Capacity = -7888.539 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	552.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 552.000 kips

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.125000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =     -0.0004030 radians
Maximum bending moment           =       2068086. inch-lbs
Maximum shear force              =  -9502.2397158 lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     39.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.250000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0008061 radians
Maximum bending moment           =       4136171. inch-lbs
Maximum shear force              =        -19004. lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     39.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.500000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection              =      0.5000000 inches
Computed slope at pile head       =     -0.0016070 radians
Maximum bending moment            =       8250255. inch-lbs
Maximum shear force               =        -37927. lbs
Depth of maximum bending moment   =     28.5000000 feet below pile head
Depth of maximum shear force      =     39.0000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 1.000000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0031343 radians
Maximum bending moment           =      15752525. inch-lbs
Maximum shear force              =        -73791. lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     40.5000000 feet below pile head
Number of iterations             =              7
Number of zero deflection points =              5
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	4	y = 0.1250	M = 0.000	552000.	0.12500000	2068086.	-9502.2397	-0.00040303
2	4	y = 0.2500	M = 0.000	552000.	0.25000000	4136171.	-19004.	-0.00080607
3	4	y = 0.5000	M = 0.000	552000.	0.50000000	8250255.	-37927.	-0.00160701
4	4	y = 1.0000	M = 0.000	552000.	1.00000000	15752525.	-73791.	-0.00313428

                                Problem Title
--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) No Weak Zone, 94' scour elev., Fixed

--------------------------------------------------------------------------------
                           Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

```
 - Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed                =          500
- Deflection tolerance for convergence                =   1.0000E-05 in
- Maximum allowable deflection                        =     100.0000 in
- Number of pile increments                           =          100

Loading Type and Number of Cycles of Loading:
 - Static loading specified

Computational Options:
 - Use unfactored loads in computations (conventional analysis)
 - Compute pile response under loading and nonlinear bending properties of pile
   (only if nonlinear pile properties are input)
 - Use of p-y modification factors for p-y curves not selected
 - Loading by lateral soil movements acting on pile not selected
 - Input of shear resistance at the pile tip not selected
 - Computation of pile-head foundation stiffness matrix not selected
 - Push-over analysis of pile not selected
 - Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

---------------------------------------------------------------------------
                    Pile Structural Properties and Geometry
---------------------------------------------------------------------------

Total number of pile sections                        =        1

Total length of pile                                 =     150.00 ft

Depth of ground surface below top of pile            =      21.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point         Depth              Pile
                X              Diameter
                ft                in
-----       ---------        -----------
  1          0.00000         48.0000000
  2        150.000000        48.0000000

Input Structural Properties:
----------------------------

Pile Section No. 1:

   Section Type                                      = Steel Pipe Pile
   Section Length                                    =    150.00000 ft
   Pile Diameter                                     =     48.00000 in

---------------------------------------------------------------------------
                      Ground Slope and Pile Batter Angles
---------------------------------------------------------------------------

Ground Slope Angle                                   =        0.000 degrees
                                                     =        0.000 radians
```

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

--------------------------------------------------------------------------------
                      Soil and Rock Layering Information
--------------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     21.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

--------------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	21.000	57.600	36.000	default
		63.000	57.600	36.000	default

		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	5	y = 0.12500 in	S = 0.0000 in/in	552000.	No
2	5	y = 0.25000 in	S = 0.0000 in/in	552000.	No
3	5	y = 0.50000 in	S = 0.0000 in/in	552000.	No
4	5	y = 1.00000 in	S = 0.0000 in/in	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

Moment of Inertia = 59287. in^4
Elastic Bending Stiffness = 1.7193E+09 kip-in^2
Plastic Modulus, Z = 3244.50000 in^3
Plastic Moment Capacity = Fy Z = 116802. in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 7888.539 kips
Nominal Axial Tensile Capacity = -7888.539 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	552.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 552.000 kips

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.125000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection              =      0.1250000 inches
Computed slope at pile head       =   -0.000002362 radians
Maximum bending moment            =      -5717920. inch-lbs
Maximum shear force               =         25053. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =       0.000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.250000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection              =      0.2500000 inches
Computed slope at pile head       =   -0.000004701 radians
Maximum bending moment            =     -11403069. inch-lbs
Maximum shear force               =         49864. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =      1.5000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.500000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection              =      0.5000000 inches
Computed slope at pile head       =   -0.000008644 radians
Maximum bending moment            =     -21575572. inch-lbs
Maximum shear force               =         91678. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =     16.5000000 feet below pile head
Number of iterations              =              9
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 1.000000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0000146 radians
Maximum bending moment           =     -38346595. inch-lbs
Maximum shear force              =        154440. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             10
Number of zero deflection points =              5
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	5	y = 0.1250	S = 0.000	552000.	0.12500000	-5717920.	25053.	-0.00000236
2	5	y = 0.2500	S = 0.000	552000.	0.25000000	-11403069.	49864.	-0.00000470
3	5	y = 0.5000	S = 0.000	552000.	0.50000000	-21575572.	91678.	-0.00000864
4	5	y = 1.0000	S = 0.000	552000.	1.00000000	-38346595.	154440.	-0.00001456

                                Problem Title
--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) Weak Zone, 94' scour elev., Free Head

--------------------------------------------------------------------------------
                           Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

```
 - Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed                =          500
- Deflection tolerance for convergence                =   1.0000E-05 in
- Maximum allowable deflection                        =     100.0000 in
- Number of pile increments                           =          100

Loading Type and Number of Cycles of Loading:
 - Static loading specified

Computational Options:
 - Use unfactored loads in computations (conventional analysis)
 - Compute pile response under loading and nonlinear bending properties of pile
   (only if nonlinear pile properties are input)
 - Use of p-y modification factors for p-y curves not selected
 - Loading by lateral soil movements acting on pile not selected
 - Input of shear resistance at the pile tip not selected
 - Computation of pile-head foundation stiffness matrix not selected
 - Push-over analysis of pile not selected
 - Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

---------------------------------------------------------------------------
                    Pile Structural Properties and Geometry
---------------------------------------------------------------------------

Total number of pile sections                        =         1

Total length of pile                                 =     150.00 ft

Depth of ground surface below top of pile            =      21.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point         Depth              Pile
                X              Diameter
                ft                in
-----       ---------        -----------
  1          0.00000         48.0000000
  2        150.000000        48.0000000

Input Structural Properties:
----------------------------

Pile Section No. 1:

   Section Type                                      = Steel Pipe Pile
   Section Length                                    =    150.00000 ft
   Pile Diameter                                     =     48.00000 in

---------------------------------------------------------------------------
                      Ground Slope and Pile Batter Angles
---------------------------------------------------------------------------

Ground Slope Angle                                   =        0.000 degrees
                                                     =        0.000 radians
```

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

--------------------------------------------------------------------------------
                      Soil and Rock Layering Information
--------------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     21.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     22.00000 pcf
   Effective unit weight at bottom of layer         =     22.00000 pcf
   Friction angle at top of layer                   =     24.00000 deg.
   Friction angle at bottom of layer                =     24.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

--------------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci

		63.000	57.600	36.000	default
2	Sand (Reese, et al.)	63.000	22.000	24.000	default
		86.000	22.000	24.000	default
3	Sand (Reese, et al.)	86.000	57.600	36.000	default
		108.000	57.600	36.000	default
4	Sand (Reese, et al.)	108.000	57.600	36.000	default
		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	4	y = 0.12500 in	M = 0.0000 in-lbs	552000.	No
2	4	y = 0.25000 in	M = 0.0000 in-lbs	552000.	No
3	4	y = 0.50000 in	M = 0.0000 in-lbs	552000.	No
4	4	y = 1.00000 in	M = 0.0000 in-lbs	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

```

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.125000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =     -0.0004030 radians
Maximum bending moment           =       2067695. inch-lbs
Maximum shear force              =  -9508.8727477 lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     39.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.250000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0008060 radians
Maximum bending moment           =       4135390. inch-lbs
Maximum shear force              =        -19018. lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     39.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.500000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =     -0.0016069 radians
Maximum bending moment           =       8248643. inch-lbs
Maximum shear force              =        -37956. lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     39.0000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 1.000000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0031339 radians
Maximum bending moment           =      15747123. inch-lbs
Maximum shear force              =        -73892. lbs
Depth of maximum bending moment  =     28.5000000 feet below pile head
Depth of maximum shear force     =     40.5000000 feet below pile head
Number of iterations             =              7
Number of zero deflection points =              5
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	4	y = 0.1250	M = 0.000	552000.	0.12500000	2067695.	-9508.8727	-0.00040301
2	4	y = 0.2500	M = 0.000	552000.	0.25000000	4135390.	-19018.	-0.00080602
3	4	y = 0.5000	M = 0.000	552000.	0.50000000	8248643.	-37956.	-0.00160691
4	4	y = 1.0000	M = 0.000	552000.	1.00000000	15747123.	-73892.	-0.00313388

                                Problem Title
--------------------------------------------------------------------------------

Project Name: US 301 RBO Four Hole Swamp

Job Number: 41503-0002-0001

Client: SCDOT

Engineer: Gabriel Burnworth

Description: 48" OEP (1.5" walls) Weak Zone, 94' scour elev., Fixed Head

--------------------------------------------------------------------------------
                           Program Options and Settings
--------------------------------------------------------------------------------

Engineering Units of Input Data and Computations:
```

- Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:
- Maximum number of iterations allowed = 500
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in
- Number of pile increments = 100

Loading Type and Number of Cycles of Loading:
- Static loading specified

Computational Options:
- Use unfactored loads in computations (conventional analysis)
- Compute pile response under loading and nonlinear bending properties of pile (only if nonlinear pile properties are input)
- Use of p-y modification factors for p-y curves not selected
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- No p-y curves to be computed and reported for user-specified depths
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total number of pile sections = 1

Total length of pile = 150.00 ft

Depth of ground surface below top of pile = 21.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	48.0000000
2	150.000000	48.0000000

Input Structural Properties:

Pile Section No. 1:

Section Type = Steel Pipe Pile
Section Length = 150.00000 ft
Pile Diameter = 48.00000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 0.000 degrees
= 0.000 radians

```
Pile Batter Angle                                   =        0.000 degrees
                                                    =        0.000 radians

---------------------------------------------------------------------------
                      Soil and Rock Layering Information
---------------------------------------------------------------------------

The soil profile is modelled using 4 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     21.00000 ft
   Distance from top of pile to bottom of layer     =     63.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     63.00000 ft
   Distance from top of pile to bottom of layer     =     86.00000 ft
   Effective unit weight at top of layer            =     22.00000 pcf
   Effective unit weight at bottom of layer         =     22.00000 pcf
   Friction angle at top of layer                   =     24.00000 deg.
   Friction angle at bottom of layer                =     24.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =     86.00000 ft
   Distance from top of pile to bottom of layer     =    108.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer        =    108.00000 ft
   Distance from top of pile to bottom of layer     =    206.00000 ft
   Effective unit weight at top of layer            =     57.60000 pcf
   Effective unit weight at bottom of layer         =     57.60000 pcf
   Friction angle at top of layer                   =     36.00000 deg.
   Friction angle at bottom of layer                =     36.00000 deg.
   Subgrade k at top of layer                       =       0.0000 pci
   Subgrade k at bottom of layer                    =       0.0000 pci

   NOTE: Internal default values for subgrade k will be computed for this soil layer.

   (Depth of lowest soil layer extends   56.00 ft below pile tip)

---------------------------------------------------------------------------
```

Summary of Soil Properties

Layer Num.	Layer Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci
1	Sand (Reese, et al.)	21.000	57.600	36.000	default
		63.000	57.600	36.000	default
2	Sand (Reese, et al.)	63.000	22.000	24.000	default
		86.000	22.000	24.000	default
3	Sand (Reese, et al.)	86.000	57.600	36.000	default
		108.000	57.600	36.000	default
4	Sand (Reese, et al.)	108.000	57.600	36.000	default
		206.000	57.600	36.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	5	y = 0.12500 in	S = 0.0000 in/in	552000.	No
2	5	y = 0.25000 in	S = 0.0000 in/in	552000.	No
3	5	y = 0.50000 in	S = 0.0000 in/in	552000.	No
4	5	y = 1.00000 in	S = 0.0000 in/in	552000.	No

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	=	150.00000 ft
Outer Diameter of Pipe	=	48.00000 in
Pipe Wall Thickness	=	1.50000 in
Yield Stress of Pipe	=	36.00000 ksi
Elastic Modulus	=	29000. ksi
Cross-sectional Area	=	219.12609 sq. in.

Moment of Inertia = 59287. in^4
Elastic Bending Stiffness = 1.7193E+09 kip-in^2
Plastic Modulus, Z = 3244.50000 in^3
Plastic Moment Capacity = Fy Z = 116802. in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 7888.539 kips
Nominal Axial Tensile Capacity = -7888.539 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	552.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 552.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Total Stress ksi	Run Msg

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip
1	552.000	115077.2

Note that the values in the above table are not factored by a strength

reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.125000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.1250000 inches
Computed slope at pile head      =   -0.000002362 radians
Maximum bending moment           =      -5716778. inch-lbs
Maximum shear force              =         25048. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =     13.5000000 feet below pile head
Number of iterations             =              6
Number of zero deflection points =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.250000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 2:

```
Pile-head deflection              =      0.2500000 inches
Computed slope at pile head       =   -0.000004700 radians
Maximum bending moment            =     -11400667. inch-lbs
Maximum shear force               =         49852. lbs
Depth of maximum bending moment   =       0.000000 feet below pile head
Depth of maximum shear force      =     21.0000000 feet below pile head
Number of iterations              =              6
Number of zero deflection points  =              5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 0.500000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 3:

```
Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =   -0.000008639 radians
Maximum bending moment           =     -21564937. inch-lbs
Maximum shear force              =         91621. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =      12.0000000 feet below pile head
Number of iterations             =               9
Number of zero deflection points =               5
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Pile-head Rotation (Loading Type 5)
Displacement of pile head = 1.000000 inches
Rotation of pile head = 0.000E+00 radians
Axial load on pile head = 552000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0000145 radians
Maximum bending moment           =     -38300450. inch-lbs
Maximum shear force              =        154203. lbs
Depth of maximum bending moment  =       0.000000 feet below pile head
Depth of maximum shear force     =     21.0000000 feet below pile head
Number of iterations             =             10
Number of zero deflection points =              4
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	5	y = 0.1250	S = 0.000	552000.	0.12500000	-5716778.	25048.	-0.00000236
2	5	y = 0.2500	S = 0.000	552000.	0.25000000	-11400667.	49852.	-0.00000470
3	5	y = 0.5000	S = 0.000	552000.	0.50000000	-21564937.	91621.	-0.00000864
4	5	y = 1.0000	S = 0.000	552000.	1.00000000	-38300450.	154203.	-0.00001454

APPENDIX F
BRIDGE APPROACH EMBANKMENT SLOPE STABILITY ANALYSES

The following slope stability analyses have been included in this appendix.

- Bent 1 – Longitudinal Circular Short-Term Static Service Limit State Slope Stability
- Bent 1 – Longitudinal Circular SEE EEI Limit State Slope Stability
- Bent 8 – Longitudinal Circular Short-Term Static Service Limit State Slope Stability
- Bent 8 – Longitudinal Circular SEE EEI Limit State Slope Stability
