## CULVERT INFORMATION

The existing twin box culvert is located on SC 18 (N. Limestone St.) near the I-85 Exit 95/SC 18 (Gaffney) exit over Providence Branch in Cherokee County, South Carolina. The twin cast-in-place reinforced concrete culvert was originally constructed in the year 1937 and later was lengthened in the year 1970 with same size culvert. The length of twin culverts built in 1937 was 63 Ft. and the after extensions in the year 1970, the total length of culvert is 94 ft. The material properties of the original 1937 construction is unknown. Based on the Manual of Bridge Evaluation, for the twin box culvert constructed in the year 1937, a concrete  $f'_c$  value of 2.5 ksi & reinforcing steel  $F_y$  value of 33 ksi were assumed for the analysis and determination of moment and shear capacities of the twin box-culvert. The existing plans can be found in Appendix A.

**Figure 1 – SC 18 over culvert (looking south)**

The twin reinforced concrete box culvert has clear spans of 10'-0" and a clear rise of 10'-0". For the existing condition, the earth cover is 10' based on the original 1928 construction plans and the culvert widening plans of 1970 (top of grade – top of culvert = 640.65 – 630.66; say = 10 ft.).

The culvert is in generally good condition with minimal cracking noticed and minimal scour at the inlet and outlet. It was noted that there were some minor leaks and deteriorations (see Figures 5 & 6). Additionally, scour of bottom slab was noted in the north barrel floor. Ridges could be seen and felt where the rebar is located and it will not be too long before the rebar becomes exposed (see figure 7).

Existing Culvert on SC 18 Near I-85 Exit 95 Over Providence Branch

**Figure 4 – View of culvert outlet (looking upstream)**

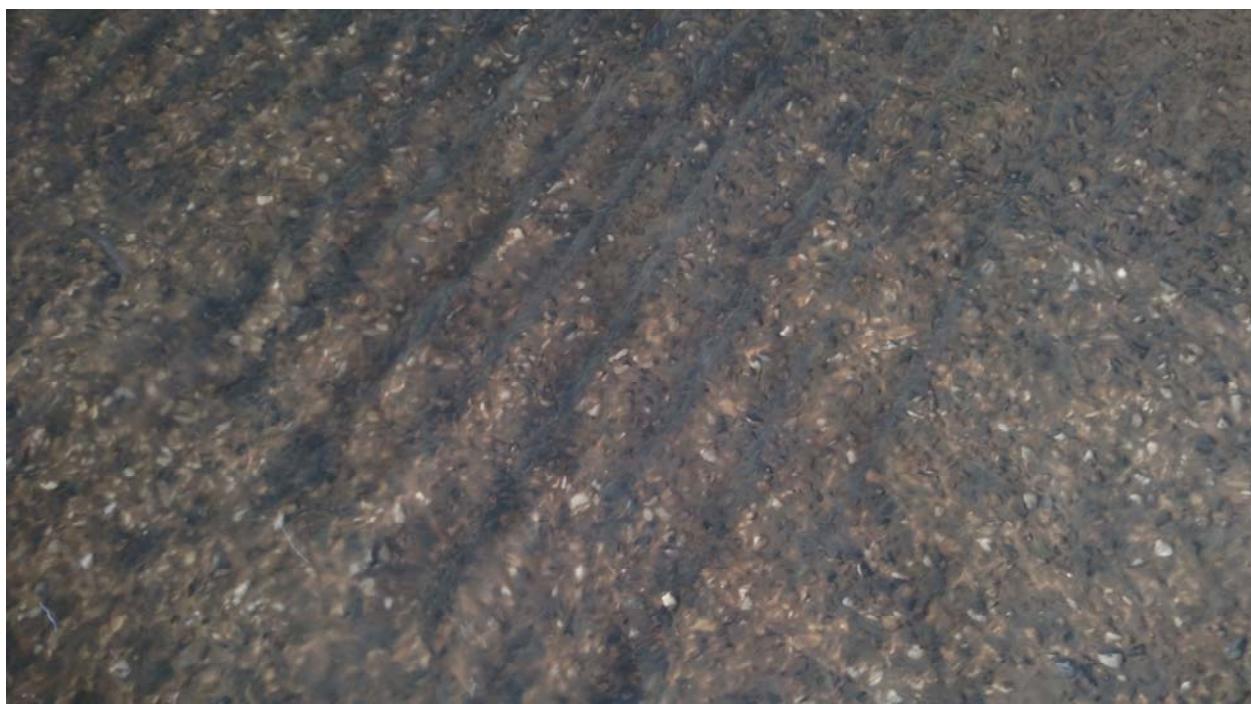

**Figure 5 – Crack/leak in culvert wall**

Existing Culvert on SC 18 Near I-85 Exit 95 Over Providence Branch

**Figure 6 – Deterioration at Wall Base**

**Figure 7 – Rebar in bottom slab in north barrel**

For the proposed embankment condition, the earth cover is 16' based on the original 1928 construction plan and the proposed I-85 widening plans (Top of grade – Top of Culvert = 646.61 – 630.66; say = 16 Ft.). Unit weight of earth fill is assumed to be 120 lb./cu.ft. For the purpose of this study the effects of any additional earth pressure due to ground water is ignored.

## **METHODOLOGY**

A twin (2-cell) reinforced concrete box culvert was analyzed and forces and load capacities was determined using BRASS software. Load Factor method was utilized for determining the forces and capacities. The twin-box culvert was analyzed for forces due to live load caused by AASHTO HS 20 truck load. The wheel loads are distributed through fills according to AASHTO 6.4.1 as uniformly distributed over a rectangle area with one side equal to 1.75 times the depth of the fill plus the wheel width for two vehicles and the other side equal to 1.75 times the depth of the fill plus the wheel length. The load placement and calculation of maximum live load moment due to HS20 truck load are computed by BRASS.

In the BRASS program an at-rest pressure coefficient of 0.5 is used based on assumed medium dense sand or gravel backfill (see AASHTO LRFD Table 3.11.5.5.1). In addition, lateral earth pressure due to 2' of earth as live load surcharge is also included in the analysis.

The twin-box culverts were analyzed for both the existing earth cover of 10 Ft. and proposed earth cover for 16 Ft. due to new embankment construction on top of existing culverts. The reinforcement in the twin-box culvert lengthening constructed in the year 1970 is significantly more than the reinforcement utilized in the original twin-box culvert (see Appendix A). Thus the capacity of existing twin-box culvert is controlled by the original portion constructed in the year 1937.

The twin culverts are 10'x10'. All the side walls are 10" thick. The top slab has a variable thickness varying from 10" at the face of the exterior wall to 12" at the face of the interior wall. Because of this variation, at the maximum positive moment location thickness of top slab is about 10.8". As the top slab thickness varies, three different models were created for determining the actual capacities at the locations 1, 2, 3 in top slab and 4, 5 & 6 in bottom slab (see Appendix B). In addition, as the negative moment reinforcement for the top & bottom of exterior wall is not same as the negative moment reinforcement for the top & bottom slab at the exterior support, an additional model was created for determining moment capacity of exterior walls.

All these models were first analyzed for the existing condition with an earth cover of 10 ft. Similar to the aforementioned four BRASS models for existing earth cover of 10 Ft., four additional models were created for the proposed embankment condition with an earth cover of 16 ft. Even though the culvert reinforcement for the proposed embankment is same as the existing condition, since BRASS computes the moment capacity based on the beam-column action, the moment capacity is slightly more due to increased axial load caused by the additional fill.

The summary of factored moment and moment capacities and factored shear and shear capacities for various critical locations are presented in Appendix B. The factored moment and shear are due to combined factored effects due to dead load, earth pressure, HS20 truck live load, and live load surcharge. Also a twin-box culvert section with the locations of the critical section is included in Appendix B. The BRASS analysis and capacity check calculations for all the four models are given in Appendix C for existing condition and Appendix D for proposed embankment condition with 16 Ft. earth cover.

### **SUMMARY OF LOAD CAPACITY CHECK RESULTS**

Based on the BRASS culvert load capacity check and summary results provided in Appendix B, for the existing condition, the performance ratios for both moment and shear are less than 1.05 at all locations except at the top and bottom slab exterior support. At the exterior support of the top slab, due to a small reinforcement of #5@ 12" o.c., there is 22% overstress in the total factored moment. Similarly, at the exterior support of bottom slab, there is 11% over stress in the total factored moment. Based on the field visit, it appears the twin-culvert is in fair condition with no significant cracks as stated and shown above. As such, it appears that due to some moment redistribution to mid-span and interior support, the overstress in the top and bottom slab at the exterior support location may have been reduced reaching less than 5% overstress. Another possibility is that the reinforcement yield stress of the original culvert is higher than assumed providing additional capacity. These factors reflect that the existing culvert is adequate for the existing loading condition.

For the proposed condition, due to the 6 ft. of additional earth fill with new embankment, there is considerable overstress in the entire regions of both the top and bottom slab. The following table summarizes the calculated moment and shear in each overstressed location:

Proposed Condition - Results Summary		
Location	Moment	Shear
Top Slab Exterior Support	53% overstressed	13% overstressed
Top Slab Mid-span	47% overstressed	N/A
Top Slab Interior Support	20% overstressed	2% overstressed
Bottom Slab Exterior Support	37% overstressed	7% overstressed
Bottom Slab Mid-Span	51% overstressed	N/A
Bottom Slab Interior Support	43% overstressed	27% overstressed

**Table 1 – Moment/Shear Results Summary**

## **RECOMMENDATIONS**

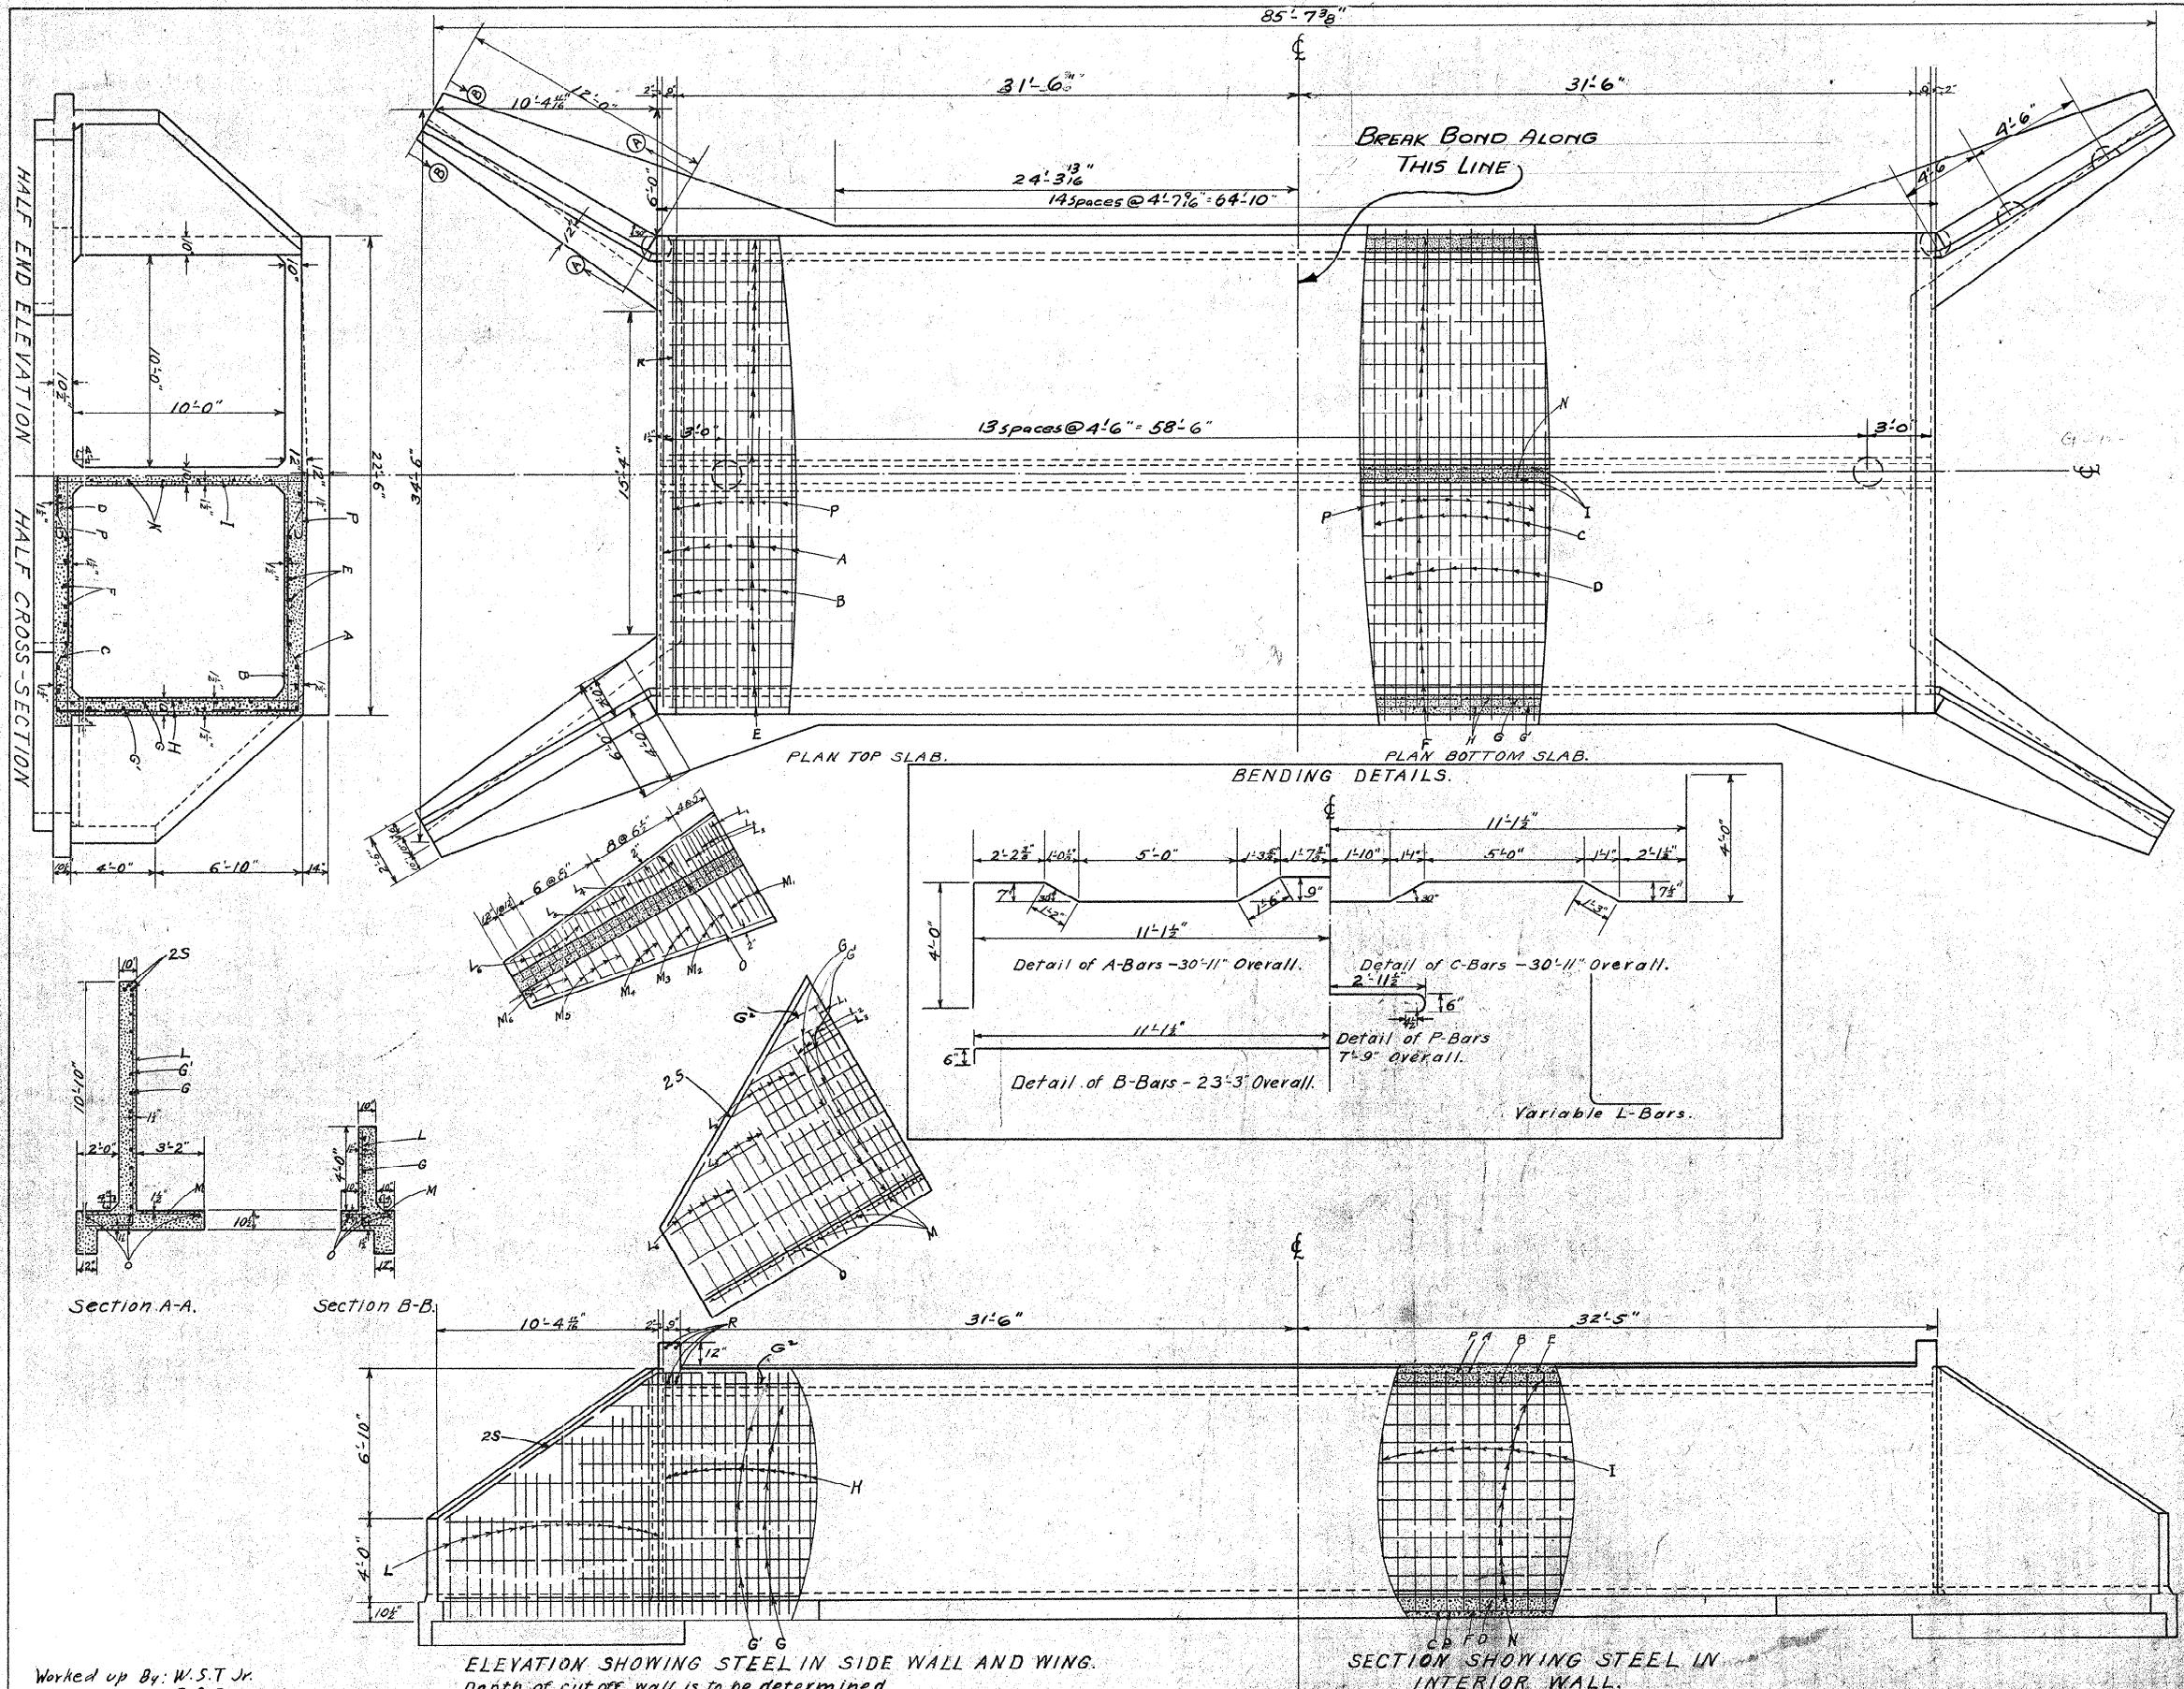

Due to the analysis of the culvert showing that the existing culvert is near its stress limit, along with its age, current condition of the culvert, and overstressing of the culvert with additional fill, it is recommended that the existing box-culvert be removed and replaced if any additional embankment is required above the culvert.

If replaced, the culvert shall be replaced with a structure that meets all hydraulic requirements and be designed per LRFD specifications. The replacement of the culvert will require a hydraulic analysis to be performed and FEMA coordination will be necessary as Providence Branch is a Zone AE FEMA detailed study area with base flood elevations established.

APPROXIMATE QUANTITIES	
REINFORCING STEEL	18,687 Lbs.
CLASS A CONCRETE	180.34 Cu.yds
EXCAVATION 1'	75.69 Cu.yds

**NOTES:-**

- All exposed edges are to be chamfered 1".
- The parapet walls shall be poured at the same time as the top slab.
- All dimensions relating to steel are to centers of bars. All reinforcing steel is to be deformed bars, square-twisted bars not considered deformed.
- All laps are to be at least 40 diameters of bar.
- Forms for exposed surfaces shall be of dressed lumber.
- Forms shall be removed when directed by the Engineer and exposed surfaces finished by rubbing with a corborundum brick. Top surfaces are to be tamped and travelled so as to provide a smooth neat finish.
- Forms to be cleaned if deemed necessary by Res. Engg. and Concrete Co. all caps added to quantities shown.

## JOB DESCRIPTION

Title : DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK  
 Structure ID : XIST CHECK  
 Agency name : MEAD &

Input units : US  
 Output units : US

ANALYSIS CONTROL	Moment	Bottom Slab	Negative	
Construction Type	Design/Review	Continuity Released	Support Code	Moment Position
CAST-IN-PLACE	DESREV	NO	FULL	1.00

Consider Haunches in Analysis : YES  
 Perform Edge Beam reinforcement computations : NO  
 Use epoxy coated bars in top mat of reinforcement: NO  
 in top slab

Design Method	Load Factors	Resistance Factors		
	Dead Load	Live Load	Moment	Shear
LOAD FACTOR	1.0000	1.6670	0.90	0.85

## OUTPUT CONTROLS

Drawing File:	NO
Actions at tenth Points:	YES
Bar Schedule:	NO
Live Load Influence Ordinates:	NO
Live Load Actions Envelope:	YES
Default Output:	YES
Intermediate Design Iteration Computations:	NO
Intermediate Computations	NO

## MATERIAL PROPERTIES

Concrete f'c (Psi)	Concrete Ec (Psi)	Crack Width Parameter Z	Steel Fy (Kip/in)	Steel n (Psi)
2500.	3653288.	155.	33000.	7.94

## Note:

1. The concrete unit weight used for the Ec computation is 5 pcf less than used for load computations
2. The crack width parameter Z is used by AASHTO Sec. 8.16.8.4, Eq. 8-61 for computing the reinforcing stress strength

Unit Weights  
 Concrete (Pcf)      Soil Fill (Pcf)      Wearing Surface (Pcf)  
 150.                120.                145.

## Note:

1. The Soil Structure Interaction Factor from AASHTO is computed and applied to the weight of earth input

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	10.0000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.8542 Ft.
Fill Height(top of slab)	=	10.0000 Ft.
Wearing surface thickness	=	0.0000 In.

Loads based on 1 foot unit width  
 Soil Structure Interaction Factor (embank) = 1.0889  
 Earth Weight for fill computations = 0.1307 Kcf

Weight of Fill without wearing surface	=	1.3067 Klf
Weight of Wearing Surface	=	0.0000 Klf
Weight of Top Slab	=	0.1250 Klf
Weight of Extra Uniform Dead Load	=	0.0000 Klf
Uniform Dead Load on Top Slab	=	1.4317 Klf

Weight of Walls divided by culvert width	=	0.1731 Klf
Uniform Dead Load on Bottom Slab	=	1.6047 Klf

Soil pressure at center of top slab	=	0.5208 Klf
Soil pressure at center of bottom slab	=	1.0635 Klf

Soil pressure due to live load surcharge	=	0.1000 Klf
--	---	------------

Impact Factor on Top Slab & Walls	=	0.0000
Impact Factor on Bottom Slab	=	0.0000

Axle Load Distribution Factor on:		
Top Slab & Walls	=	0.0569
on Bottom Slab	=	0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

Varying axle spacing from 14.0 feet to 30.0 feet by 1 foot increments.

For a HS20T / No Lane Vehicle, Variable Axle Spacing  
 Description AASHTO HS20-44 (MS 18) TRUCK (US) / No Lane Specified  
 The Number of axles = 3  
 Beginning rear axle spacing = 14.00

Axle Weights (kips)	Spacing (ft)
8.00	14.000
32.00	14.000
32.00	0.000
<hr/>	
Totals	28.000

Tire Contact Area = 40.00000 sq.in.  
 Tire patch Width = 20.00000 in.  
 Tire Patch Length = 2.000000 in.

Vehicle Axle number = 1  
 Fill = 10.00 ft.  
 Distribution slope = 1.75  
 LL Longitudinal Distribution Length = 17.67 ft.  
 [slope(fill) + longitudinal tire patch]

Tire Contact Area = 160.00000 sq.in.  
 Tire patch Width = 20.00000 in.  
 Tire Patch Length = 8.000000 in.

Vehicle Axle number = 2  
 Fill = 10.00 ft.  
 Distribution slope = 1.75  
 LL Longitudinal Distribution Length = 18.17 ft.  
 [slope(fill) + longitudinal tire patch]

Tire Contact Area = 160.00000 sq.in.  
 Tire patch Width = 20.00000 in.  
 Tire Patch Length = 8.000000 in.

Vehicle Axle number = 3  
 Fill = 10.00 ft.  
 Distribution slope = 1.75  
 LL Longitudinal Distribution Length = 18.17 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

Serviceability, Fatigue, and Other Checks

Based on crack control check  
 AASHTO 16.6.4.7  
 Factor Z = 155. k/in for precast or cast-in-place  
 modified by a depth factor for CIP.

Slenderness check on walls passed  
 Eccentricity check on walls passed

Reinforcing Bar Stresses Sizes and Spacing

Note: Bar stresses are based on bending and axial stress only

Stresses are in ksi

Area of steel in square inches per ft

Spacing and H and V legs are in inches

Bar Mark	Description
A1	Top Corner Outside face Max Neg Moment
A100	Top Slab Inside face Max Pos Moment
A300	Top Slab Outside face Max Neg Moment Interior support
A2	Bottom Corner Outside face Max Neg Moment
A200	Bottom Slab Inside face Max Pos Moment
A400	Bottom Slab Outside face Max Neg Moment Interior support
B2	Exterior Wall Outside face Max Neg Moment
B1	Exterior Wall Inside face Max Pos Moment
B3	Interior Wall Both faces

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

Warnings:

- For exterior corners, BRASS-CULVERT does not perform a check on both the exterior wall and top or bottom slab. BRASS-CULVERT only checks the location that it has determined requires a greater area of steel. Because of this, BRASS-CULVERT may check one location for a particular culvert (e.g. top of the wall) and a different location (e.g. left end of top slab) for the same culvert with a different depth of fill.
- If the flexural resistance is zero and rebar has been entered, it could be due to the axial load being higher than the tensile capacity of the rebar provide. For example, the axial load is greater than the area of steel times the yield strength of the bars.

PAGE 27  
 DATE 03/06/2016  
 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Top and Bot Slab Exterior Support-Exist.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

EXTERIOR WALL Minimum Thickness Based on Cover and Layer Clearance  
AASHTO 8.21.3 (minimum thickness)  
Equation 2 = exterior wall cover plus the diameter of two #6 bars and  
two #4 bars plus the inside wall/slab cover plus 1 in clearance

Required Thickness is 7.00 Inches

PAGE 11  
DATE 03/06/2016  
BRASS-CULVERT Version 2.7  
I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Span length 10.833  
Center line skew 0.0  
Equiv. strip width = (4+0.06\*SPAN) 4.65000

Live Load Parameters for a HS20T vehicle

Fill	= 10.00000 Ft.
Tire patch width	= 20.00000 In.
Equiv. strip width = FILL*1.75+TPATW/12+16	= 35.16666 Ft.
Lay length (precast -- two wheels check)	= 94.000 Ft.
Wheel factor	= 2.00000
Controlling strip width	= 35.16666 Ft.
Wheel factor	= 2.00000
Distr. factor top & walls = wheel_factor/ (Ctrl Strip)	= 0.05687
Distr. factor bottom ((Ctrl Strip)+2*cellhgt)	= wheel_factor = 0.02028

PAGE 12  
 DATE 03/06/2016

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	10.8000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.8875 Ft.
Fill Height(top of slab)	=	10.0000 Ft.
Wearing surface thickness	=	0.0000 In.

Loads based on 1 foot unit width  
 Soil Structure Interaction Factor (embank) = 1.0889  
 Earth Weight for fill computations = 0.1307 Kcf

Weight of Fill without wearing surface	=	1.3067 Klf
Weight of Wearing Surface	=	0.0000 Klf
Weight of Top Slab	=	0.1350 Klf
Weight of Extra Uniform Dead Load	=	0.0000 Klf
Uniform Dead Load on Top Slab	=	1.4417 Klf

Weight of Walls divided by culvert width	=	0.1731 Klf
Uniform Dead Load on Bottom Slab	=	1.6147 Klf

Soil pressure at center of top slab	=	0.5225 Klf
Soil pressure at center of bottom slab	=	1.0669 Klf

Soil pressure due to live load surcharge	=	0.1000 Klf
--	---	------------

Impact Factor on Top Slab & Walls	=	0.0000
Impact Factor on Bottom Slab	=	0.0000

Axle Load Distribution Factor on:		
Top Slab & Walls	=	0.0569
on Bottom Slab	=	0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

Warnings:

- For exterior corners, BRASS-CULVERT does not perform a check on both the exterior wall and top or bottom slab. BRASS-CULVERT only checks the location that it has determined requires a greater area of steel. Because of this, BRASS-CULVERT may check one location for a particular culvert (e.g. top of the wall) and a different location (e.g. left end of top slab) for the same culvert with a different depth of fill.
- If the flexural resistance is zero and rebar has been entered, it could be due to the axial load being higher than the tensile capacity of the rebar provide. For example, the axial load is greater than the area of steel times the yield strength of the bars.

PAGE 27  
 DATE 03/06/2016  
 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Top and Bot Slab MidSpan-Exist.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	12.0000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.9375 Ft.
Fill Height(top of slab)	=	10.0000 Ft.
Wearing surface thickness	=	0.0000 In.

Loads based on 1 foot unit width  
 Soil Structure Interaction Factor (embank) = 1.0889  
 Earth Weight for fill computations = 0.1307 Kcf

Weight of Fill without wearing surface	=	1.3057 Klf
Weight of Wearing Surface	=	0.0000 Klf
Weight of Top Slab	=	0.1500 Klf
Weight of Extra Uniform Dead Load	=	0.0000 Klf
Uniform Dead Load on Top Slab	=	1.4567 Klf

Weight of Walls divided by culvert width	=	0.1731 Klf
Uniform Dead Load on Bottom Slab	=	1.6297 Klf

Soil pressure at center of top slab	=	0.5250 Klf
Soil pressure at center of bottom slab	=	1.0719 Klf

Soil pressure due to live load surcharge	=	0.1000 Klf
--	---	------------

Impact Factor on Top Slab & Walls	=	0.0000
Impact Factor on Bottom Slab	=	0.0000

Axle Load Distribution Factor on:		
Top Slab & Walls	=	0.0569
on Bottom Slab	=	0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

---

Serviceability, Fatigue, and Other Checks

---

Based on crack control check  
 AASHTO 16.6.4.7  
 Factor Z = 155. k/in for precast or cast-in-place  
 modified by a depth factor for CIP.

Slenderness check on walls passed  
 Eccentricity check on walls passed

---

Reinforcing Bar Stresses Sizes and Spacing

---

Note: Bar stresses are based on bending and axial stress only  
 Stresses are in ksi  
 Area of steel in square inches per ft  
 Spacing and H and V legs are in inches

Bar Mark	Description
A1	Top Corner Outside face Max Neg Moment
A100	Top Slab Inside face Max Pos Moment
A300	Top Slab Outside face Max Neg Moment Interior support
A2	Bottom Corner Outside face Max Neg Moment
A200	Bottom Slab Inside face Max Pos Moment
A400	Bottom Slab Outside face Max Neg Moment Interior support
B2	Exterior Wall Outside face Max Neg Moment
B1	Exterior Wall Inside face Max Pos Moment
B3	Interior Wall Both faces

Bar Type	Fs Act.	Fs All.	Area steel		Size US	Spacing	H	V

BRASS-CULVERT Version 2.7  
I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

PAGE 26

 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Top and Bot Slab Interior Support-Exist.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

Intermediate Computations	NO

## MATERIAL PROPERTIES

Concrete f'c	Concrete Ec	Crack Width Parameter Z	Steel Fy	Steel n
(Psi) 2500.	(Psi) 3653288.	155.	33000.	7.94
				(Kip/in) (Psi)

## Note:

1. The concrete unit weight used for the Ec computation is 5 pcf less than used for load computations
2. The crack width parameter Z is used by AASHTO Sec. 8.16.8.4, Eq. 8-61 for computing the reinforcing stress strength

Unit Weights  
 Concrete (Pcf) 150.      Soil Fill (Pcf) 120.      Wearing Surface (Pcf) 145.

## Note:

1. The Soil Structure Interaction Factor from AASHTO is computed and applied to the weight of earth input

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	10.0000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.8542 Ft.
Fill Height(top of slab)	=	10.0000 Ft.
Wearing surface thickness	=	0.0000 In.

Loads based on 1 foot unit width  
 Soil Structure Interaction Factor (embank) = 1.0889  
 Earth Weight for fill computations = 0.1307 Kcf

Weight of Fill without wearing surface	=	1.3067 Klf
Weight of Wearing Surface	=	0.0000 Klf
Weight of Top Slab	=	0.1250 Klf
Weight of Extra Uniform Dead Load	=	0.0000 Klf
Uniform Dead Load on Top Slab	=	1.4317 Klf

Weight of Walls divided by culvert width	=	0.1731 Klf
Uniform Dead Load on Bottom Slab	=	1.6047 Klf

Soil pressure at center of top slab	=	0.5208 Klf
Soil pressure at center of bottom slab	=	1.0635 Klf

Soil pressure due to live load surcharge	=	0.1000 Klf
--	---	------------

Impact Factor on Top Slab & Walls	=	0.0000
Impact Factor on Bottom Slab	=	0.0000

Axle Load Distribution Factor on:		
Top Slab & Walls	=	0.0569
on Bottom Slab	=	0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

Warnings:

- For exterior corners, BRASS-CULVERT does not perform a check on both the exterior wall and top or bottom slab. BRASS-CULVERT only checks the location that it has determined requires a greater area of steel. Because of this, BRASS-CULVERT may check one location for a particular culvert (e.g. top of the wall) and a different location (e.g. left end of top slab) for the same culvert with a different depth of fill.
- If the flexural resistance is zero and rebar has been entered, it could be due to the axial load being higher than the tensile capacity of the rebar provide. For example, the axial load is greater than the area of steel times the yield strength of the bars.

PAGE 27  
DATE 03/06/2016  
BRASS-CULVERT Version 2.7  
I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Wall-Support Exist.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	10.0000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.8542 Ft.
Fill Height(top of slab)	=	16.0000 Ft.
Wearing surface thickness	=	0.0000 In.
 Loads based on 1 foot unit width		
Soil Structure Interaction Factor (embank) =		1.1422
Earth Weight for fill computations =		0.1371 Kcf
 Weight of Fill without wearing surface = 2.1931 Klf		
Weight of Wearing Surface =		0.0000 Klf
Weight of Top Slab =		0.1250 Klf
Weight of Extra Uniform Dead Load =		0.0000 Klf
Uniform Dead Load on Top Slab =		2.3181 Klf
 Weight of Walls divided by culvert width = 0.1731 Klf		
Uniform Dead Load on Bottom Slab =		2.4911 Klf
 Soil pressure at center of top slab = 0.8208 Klf		
Soil pressure at center of bottom slab =		1.3635 Klf
 Soil pressure due to live load surcharge = 0.1000 Klf		
Impact Factor on Top Slab & Walls =		0.0000
Impact Factor on Bottom Slab =		0.0000
 Axe Load Distribution Factor on:		
Top Slab & Walls =		0.0438
on Bottom Slab =		0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

Serviceability, Fatigue, and Other Checks

Based on crack control check  
 AASHTO 16.6.4.7  
 Factor Z = 155. k/in for precast or cast-in-place  
 modified by a depth factor for CIP.

Slenderness check on walls passed  
 Eccentricity check on walls passed

Reinforcing Bar Stresses Sizes and Spacing

Note: Bar stresses are based on bending and axial stress only  
 Stresses are in ksi  
 Area of steel in square inches per ft  
 Spacing and H and V legs are in inches

Bar Mark	Description
A1	Top Corner Outside face Max Neg Moment
A100	Top Slab Inside face Max Pos Moment
A300	Top Slab Outside face Max Neg Moment Interior support
A2	Bottom Corner Outside face Max Neg Moment
A200	Bottom Slab Inside face Max Pos Moment
A400	Bottom Slab Outside face Max Neg Moment Interior support
B2	Exterior Wall Outside face Max Neg Moment
B1	Exterior Wall Inside face Max Pos Moment
B3	Interior Wall Both faces

Bar Type	Fs Act.	Fs All.	Area steel		Size US Bars	Spacing (In)	H (In)	V (In)
			Input (Ksi)	Provided (In <sup>2</sup> )

BRASS-CULVERT Version 2.7  
I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

PAGE 26

 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the  
 X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Top and Bot Slab Exterior Support-Prop.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

## OUTPUT CONTROLS

Drawing File:	NO
Actions at tenth Points:	YES
Bar Schedule:	NO
Live Load Influence Ordinates:	NO
Live Load Actions Envelope:	YES
Default Output:	YES
Intermediate Design Iteration Computations:	NO
Intermediate Computations	NO

## MATERIAL PROPERTIES

Concrete f'c (Psi)	Concrete Ec (Psi)	Crack Width Parameter Z	Steel Fy (Kip/in)	Steel n (Psi)
2500.	3653288.	155.	33000.	7.94

## Note:

1. The concrete unit weight used for the Ec computation is 5 pcf less than used for load computations
2. The crack width parameter Z is used by AASHTO Sec. 8.16.8.4, Eq. 8-61 for computing the reinforcing stress strength

Unit Weights

Concrete (Pcf)	Soil Fill (Pcf)	Wearing Surface (Pcf)
150.	120.	145.

## Note:

1. The Soil Structure Interaction Factor from AASHTO is computed and applied to the weight of earth input

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	10.8000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.8875 Ft.
Fill Height(top of slab)	=	16.0000 Ft.
Wearing surface thickness	=	0.0000 In.

Loads based on 1 foot unit width  
 Soil Structure Interaction Factor (embank) = 1.1422  
 Earth Weight for fill computations = 0.1371 Kcf

Weight of Fill without wearing surface	=	2.1931 Klf
Weight of Wearing Surface	=	0.0000 Klf
Weight of Top Slab	=	0.1350 Klf
Weight of Extra Uniform Dead Load	=	0.0000 Klf
Uniform Dead Load on Top Slab	=	2.3281 Klf

Weight of Walls divided by culvert width	=	0.1731 Klf
Uniform Dead Load on Bottom Slab	=	2.5011 Klf

Soil pressure at center of top slab	=	0.8225 Klf
Soil pressure at center of bottom slab	=	1.3669 Klf

Soil pressure due to live load surcharge	=	0.1000 Klf
--	---	------------

Impact Factor on Top Slab & Walls	=	0.0000
Impact Factor on Bottom Slab	=	0.0000

Axle Load Distribution Factor on:		
Top Slab & Walls	=	0.0438
on Bottom Slab	=	0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

---

Serviceability, Fatigue, and Other Checks

---

Based on crack control check  
 AASHTO 16.6.4.7  
 Factor Z = 155. k/in for precast or cast-in-place  
 modified by a depth factor for CIP.

Slenderness check on walls passed  
 Eccentricity check on walls passed

---

Reinforcing Bar Stresses Sizes and Spacing

---

Note: Bar stresses are based on bending and axial stress only  
 Stresses are in ksi  
 Area of steel in square inches per ft  
 Spacing and H and V legs are in inches

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

Warnings:

- For exterior corners, BRASS-CULVERT does not perform a check on both the exterior wall and top or bottom slab. BRASS-CULVERT only checks the location that it has determined requires a greater area of steel. Because of this, BRASS-CULVERT may check one location for a particular culvert (e.g. top of the wall) and a different location (e.g. left end of top slab) for the same culvert with a different depth of fill.
- If the flexural resistance is zero and rebar has been entered, it could be due to the axial load being higher than the tensile capacity of the rebar provide. For example, the axial load is greater than the area of steel times the yield strength of the bars.

PAGE 27  
 DATE 03/06/2016  
 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the  
 X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Top and Bot Slab MidSpan-Prop.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	12.0000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.9375 Ft.
Fill Height(top of slab)	=	16.0000 Ft.
Wearing surface thickness	=	0.0000 In.

Loads based on 1 foot unit width  
 Soil Structure Interaction Factor (embank) = 1.1422  
 Earth Weight for fill computations = 0.1371 Kcf

Weight of Fill without wearing surface	=	2.1931 Klf
Weight of Wearing Surface	=	0.0000 Klf
Weight of Top Slab	=	0.1500 Klf
Weight of Extra Uniform Dead Load	=	0.0000 Klf
Uniform Dead Load on Top Slab	=	2.3431 Klf

Weight of Walls divided by culvert width	=	0.1731 Klf
Uniform Dead Load on Bottom Slab	=	2.5161 Klf

Soil pressure at center of top slab	=	0.8250 Klf
Soil pressure at center of bottom slab	=	1.3719 Klf

Soil pressure due to live load surcharge	=	0.1000 Klf
--	---	------------

Impact Factor on Top Slab & Walls	=	0.0000
Impact Factor on Bottom Slab	=	0.0000

Axle Load Distribution Factor on:		
Top Slab & Walls	=	0.0438
on Bottom Slab	=	0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

#### Warnings:

- For exterior corners, BRASS-CULVERT does not perform a check on both the exterior wall and top or bottom slab. BRASS-CULVERT only checks the location that it has determined requires a greater area of steel. Because of this, BRASS-CULVERT may check one location for a particular culvert (e.g. top of the wall) and a different location (e.g. left end of top slab) for the same culvert with a different depth of fill.
  - If the flexural resistance is zero and rebar has been entered, it could be due to the axial load being higher than the tensile capacity of the rebar provide. For example, the axial load is greater than the area of steel times the yield strength of the bars.

PAGE 27  
 DATE 03/06/2016  
 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the  
 X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Top and Bot Slab Interior Support-Prop.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

## OUTPUT CONTROLS

Drawing File:	NO
Actions at tenth Points:	YES
Bar Schedule:	NO
Live Load Influence Ordinates:	NO
Live Load Actions Envelope:	YES
Default Output:	YES
Intermediate Design Iteration Computations:	NO
Intermediate Computations	NO

## MATERIAL PROPERTIES

Concrete f'c (Psi)	Concrete Ec (Psi)	Crack Width Parameter Z	Steel Fy (Kip/in)	Steel n (Psi)
2500.	3653288.	155.	33000.	7.94

## Note:

1. The concrete unit weight used for the Ec computation is 5 pcf less than used for load computations
2. The crack width parameter Z is used by AASHTO Sec. 8.16.8.4, Eq. 8-61 for computing the reinforcing stress strength

Unit Weights

Concrete (Pcf)	Soil Fill (Pcf)	Wearing Surface (Pcf)
150.	120.	145.

## Note:

1. The Soil Structure Interaction Factor from AASHTO is computed and applied to the weight of earth input

 BRASS-CULVERT Version 2.7  
 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Number of cells	=	2
Top Slab thickness	=	10.0000 In.
Bottom Slab thickness	=	10.5000 In.
Exterior Wall thickness	=	10.0000 In.
Interior wall thickness	=	10.00 In.
Design Span(c-c walls)	=	10.8333 Ft.
Design Height(c-c slabs)	=	10.8542 Ft.
Fill Height(top of slab)	=	16.0000 Ft.
Wearing surface thickness	=	0.0000 In.
 Loads based on 1 foot unit width		
Soil Structure Interaction Factor (embank) =		1.1422
Earth Weight for fill computations =		0.1371 Kcf
 Weight of Fill without wearing surface = 2.1931 Klf		
Weight of Wearing Surface =		0.0000 Klf
Weight of Top Slab =		0.1250 Klf
Weight of Extra Uniform Dead Load =		0.0000 Klf
Uniform Dead Load on Top Slab =		2.3181 Klf
 Weight of Walls divided by culvert width = 0.1731 Klf		
Uniform Dead Load on Bottom Slab =		2.4911 Klf
 Soil pressure at center of top slab = 0.8208 Klf		
Soil pressure at center of bottom slab =		1.3635 Klf
 Soil pressure due to live load surcharge = 0.1000 Klf		
Impact Factor on Top Slab & Walls =		0.0000
Impact Factor on Bottom Slab =		0.0000
 Axe Load Distribution Factor on:		
Top Slab & Walls =		0.0438
on Bottom Slab =		0.0203

Note:

1. The weight of the walls is computed by taking the interior wall thickness plus twice the exterior wall thickness and multiplying by the clear height of the culvert and the weight of concrete. That result is divided by the span length times the number of cells plus the wall thicknesses.
2. The soil pressure computations use the fill height and the culvert height for appropriate values for lateral earth pressures. Wearing surface, fill height, and slab thickness are used in vertical dead load computations.
3. The distribution width and associated distribution factor for the top slab is computed according to 3.24.3.2 for fill depth less than 2 ft. and 6.4 for fill depths over 2 ft.

Varying axle spacing from 14.0 feet to 30.0 feet by 1 foot increments.

For a HS20T / No Lane Vehicle, Variable Axle Spacing  
 Description AASHTO HS20-44 (MS 18) TRUCK (US) / No Lane Specified  
 The Number of axles = 3  
 Beginning rear axle spacing = 14.00

Axle Weights (kips)	Spacing (ft)
8.00	14.000
32.00	14.000
32.00	0.000
<hr/>	
Totals	28.000

Tire Contact Area = 40.00000 sq.in.  
 Tire patch Width = 20.00000 in.  
 Tire Patch Length = 2.000000 in.

Vehicle Axle number = 1  
 Fill = 16.00 ft.  
 Distribution slope = 1.75  
 LL Longitudinal Distribution Length = 28.17 ft.  
 [slope(fill) + longitudinal tire patch]

Tire Contact Area = 160.00000 sq.in.  
 Tire patch Width = 20.00000 in.  
 Tire Patch Length = 8.000000 in.

Vehicle Axle number = 2  
 Fill = 16.00 ft.  
 Distribution slope = 1.75  
 LL Longitudinal Distribution Length = 28.67 ft.  
 [slope(fill) + longitudinal tire patch]

Tire Contact Area = 160.00000 sq.in.  
 Tire patch Width = 20.00000 in.  
 Tire Patch Length = 8.000000 in.

Vehicle Axle number = 3  
 Fill = 16.00 ft.  
 Distribution slope = 1.75  
 LL Longitudinal Distribution Length = 28.67 ft.  
 [slope(fill) + longitudinal tire patch]

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

For a HS20T                   Vehicle  
Description AASHTO HS20-44 (MS 18) TRUCK (US) / No La

The number of simulated axles is calculated based on the longitudinal distribution length of each axle divided by the simulated axle spacing of 1 foot and the simulated axle weights are calculated by dividing the vehicle axle weights by the number of simulated axles per vehicle axle.

Note: Impact or distribution is not included in the above table.

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

---

Serviceability, Fatigue, and Other Checks

---

Based on crack control check  
 AASHTO 16.6.4.7  
 Factor Z = 155. k/in for precast or cast-in-place  
 modified by a depth factor for CIP.

Slenderness check on walls passed  
 Eccentricity check on walls passed

---

Reinforcing Bar Stresses Sizes and Spacing

---

Note: Bar stresses are based on bending and axial stress only  
 Stresses are in ksi  
 Area of steel in square inches per ft  
 Spacing and H and V legs are in inches

Bar Mark	Description
A1	Top Corner Outside face Max Neg Moment
A100	Top Slab Inside face Max Pos Moment
A300	Top Slab Outside face Max Neg Moment Interior support
A2	Bottom Corner Outside face Max Neg Moment
A200	Bottom Slab Inside face Max Pos Moment
A400	Bottom Slab Outside face Max Neg Moment Interior support
B2	Exterior Wall Outside face Max Neg Moment
B1	Exterior Wall Inside face Max Pos Moment
B3	Interior Wall Both faces

Bar Type	Fs Act.	Fs All.	Area steel		Size US Bars	Spacing (In)	H (In)	V (In)
			Input (Ksi)	Provided (In2)				
A1	13.03	19.80	0.7086	0.7086	5	5.2	29	33
A2	15.66	19.80	0.7086	0.7086	5	5.2	29	33
A100	35.18	19.80	0.6200	0.6200	5	6.0		
A300	31.66	19.80	0.9000	0.9000	7	8.0		
A200	34.65	19.80	0.6200	0.6200	5	6.0		
A400	32.07	19.80	0.9000	0.9000	7	8.0		
B1	0.00	19.80	0.4000	0.4000	4	6.0		
B2	0.00	19.80	0.4000	0.4000	4	6.0		
B3	0.00	19.80	0.2667	0.2667	4	9.0		

\*\* THE HEIGHT OF C.H.C.U. \*\* BOTTOM SLAB = 7.00 IN

I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Notes:

1. Area of steel is the maximum required for all limit states. The strength computations are shown in the results at critical sections table.
2. Design thickness shown in the following table is based on the appropriate cover minus half the diameter of the bar in the above table or one-half the diameter of a #6 bar. The actual half bar diameter is used once the steel has been selected and the #6 bar is used in design iterations.
3. For a Design review run the actual bar stresses shown can be the stress at either side of a member corner or the stress at the middle of the slab for a multiple cell group. The required As is actual in a Design review.
4. If the user wishes to ignore crack control the allowable steel stress is set at 0.95 Fy. This limit will likely not control the design, but it if should, this will control yielding under service loads.

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

Output at Critical Sections (per unit design width)

Member No. = 1 EXTERIOR WALL											
Thickness = 10.00 (in)											
Clear cover at end = 1.50 (in)											
Clear cover at middle = 1.50 (in)											
Bar diameter (bot) = 0.62 (in)											
Bar diameter (mid+) = 0.50 (in)											
Bar diameter (mid-) = 0.50 (in)											
Bar diameter (top) = 0.62 (in)

 I-85 DESIGN BUILD - EMBANKMENT OVER EXISTING CULVERT CHECK

## Notes:

1. Flexure rating value of n/a indicates no live load effect on the member
2. SS value adjacent to steel area indicates a simply supported culvert and a steel area is not required
3. AASHTO 8.16.4.2
  - Po -- Axial capacity at zero eccentricity (no moment)
  - Mu -- Flexural Capacity without an axial load
  - Pbal -- Axial load at balanced strain
  - Mbal -- Moment at balanced state of strain
4. The phi factors are included
5. Coin. is the coincident axial force
6. The plane of computation for shear is a "d" distance from the face of the supporting member
7. The plane of computation for moment if haunches are used is based on AASHTO 8.8.2
8. The plane of computation for moment if haunches are not used is based on the user input
9. An asterisk next to the Design Moment indicates the Moment is greater than the All Mom. Value
10. An asterisk next to the Shear Value indicates the Shear is greater than the Allowable Shear
11. Rating factors computations consider the effect of axial force. The Allowable Moment value is used with the maximum soil pressure.
12. The load combinations and envelope of critical action combinations are shown in the  
 X:\3286900\141416.01\XXXXX (SCDOT Number)\structures\Culvert Load Rating\Results\Wall-Support Prop.ooo file.
13. For fills less than 2.0 feet, Article 3.24.4 applies, and shear is assumed to adequate because the section has been designed for moment.

Output complete for a HS20T vehicle
