ASBESTOS AND LEAD-BASED PAINT SURVEY

On February 21, 2017, ARM Environmental Services, Inc. performed an asbestos and lead-based paint survey at the US-29 (E. Cherokee St.) Bridge located in Cherokee County, South Carolina. The bridge is located over I-85 at Exit 106 as shown in Appendix A, Figure 1. The asbestos survey has been conducted in accordance with the Asbestos Hazard Emergency Response Act (AHERA) guidelines, as required by the Environmental Protection Agency (EPA) and the South Carolina Department of Health and Environmental Control (DHEC) prior to renovation or demolition of public or commercial structures. The lead-based paint survey was performed to identify lead-based paint (LBP) on the bridge.

BRIDGE MATERIALS

All accessible structural components including columns, piers, bridge decks, beams, bridge shoes, end bents, and buffer materials were examined. Photographs of the site are shown in Appendix F.

The bridge deck of the structure consists of pre-cast concrete deck sections supported by concrete pier caps. The concrete pier caps, which run perpendicular to the bridge deck, are supported by concrete piers. The structure has metal bridge shoes located between the concrete pier caps and the concrete deck sections. Concrete guardrails are located on the bridge structure. The bridge structure is estimated to be 210 feet long and 28 feet wide. There are three materials identified as suspect asbestos containing materials associated with the structure as described below:

- Brown buffer material located at the bridge ends.
- Black/Grey expansion filler located between the concrete deck sections.
- Black buffer material located between the concrete deck sections.

ASBESTOS SURVEY

Samples of the suspect materials were collected and submitted for laboratory analysis for Polarized Light Microscopy (PLM). One sample of each material was also collected for transmission electron microscopy (TEM) confirmation analysis in the event that the PLM analysis indicated less than 1 percent asbestos. The sample locations are shown in Appendix A, Figure 2. The results of the laboratory analysis are presented in Table 1 on the following page.

Page 1 ARM ENVIRONMENTAL SERVICES, INC.

Present **Estimated** Sample Suspect Analytical **Material Locations** Condition Material Number Material Results* Quantity Brown Buffer No Asbestos 40 Linear 01, 02, 03 Bridge Ends Damaged / F Material Detected Feet Black/Grev Expansion Joints between No Asbestos 150 Linear 04, 05, 06 Expansion Good / NF Concrete Deck Sections Detected Feet Filler Black Buffer **Between Concrete Deck** 3% Chrysotile 100 Linear 07, 08, 09 Damaged / F Material **Sections** Asbestos Feet

Table 1: Asbestos Sample Analytical Data

*Asbestos Content: USEPA and SCDHEC regulations (No. 61-86.1) define asbestos containing material as any material greater than one percent asbestos. OSHA recommends that a negative exposure assessment (NEA) be conducted to establish appropriate personal protection equipment needed (if any) for all persons that might disturb asbestos materials.

Notes: Good (very localized limited damage) Damaged (damage of less than 10% distributed & less than 25% localized) Significantly Damaged (damage equal to or greater than 10% distributed/25% localized) F=Friable NF=Non-Friable

*Friable: Describes a material which, when dry, can be crumbled, pulverized, or reduced to powder with hand pressure.

The laboratory results are included in Appendix C of this report.

ASBESTOS CONCLUSIONS / RECOMMENDATIONS

On February 21, 2017 ARM Environmental completed an asbestos inspection for a structure, the US-29 (E. Cherokee St.) Bridge over I-85 at Exit 106 in Cherokee County, South Carolina. The results of the asbestos survey indicate that the black buffer material between concrete deck sections contains asbestos. In its present condition, and without significant disturbance, there is a low potential for significant concentrations of asbestos fibers to be released from this material. However, it is recommended that this material be removed prior to any renovation, demolition, or other process that might disturb the material, or render it friable. Based on the potential for the ACM to be rendered friable during the removal process, it is recommended that the removal of this material be conducted by a licensed abatement contractor. No other asbestos containing materials were identified on the bridge structure.

Prior to the commencement of any asbestos abatement activities, material quantities should be verified by the abatement contractor. It is recommended that personnel who may be involved with renovation/demolition activities be advised of the presence of asbestos, and that the referenced materials be handled in accordance with applicable State and Federal regulations, including all OSHA regulations that apply. DHEC

regulations also require that all removed ACM's be disposed of at a permitted disposal facility.

The results of this asbestos survey are limited to the sampled materials, which are considered to be representative of the homogeneous areas from which the samples were collected. In the event that any suspect asbestos containing materials that were not addressed in this survey are encountered, the materials should be presumed to contain asbestos until laboratory analysis can be conducted. If the structure is to be demolished or renovated, a copy of this report and a notification of demolition or renovation forms must be submitted to the South Carolina Department of Health and Environmental Control at least ten working days prior to these activities taking place. Copies of the DHEC regulatory requirements for renovations and demolition are included in Appendix E of this report.

LEAD-BASED PAINT SURVEY

ARM personnel conducted a lead-based paint survey of accessible painted bridge materials on February 21, 2017. The LBP inspection was conducted using a Niton XLp-303A X-ray Fluorescence (XRF) Analyzer (Serial #17307) to measure the lead content of surface coatings on representative bridge building components. A homogenous bridge building component is a building material that is uniform in color, texture, and appears identical in every respect. EPA guidelines define lead-based paint as any paint with equal to or greater than 1.0 milligram of lead per square centimeter of painted surface (mg/cm²) when measured by X-ray Fluorescence. In this survey, the limit for lead in paint was decreased to 0.7 milligrams of lead per square centimeter of painted surface when measured by the XRF since the structure may be slated for renovation or demolition. All waste debris coated with lead-based paint equal to or greater than 0.7mg/cm² must be disposed of in an approved Class II (C&D) or Class III (MSWLF) landfill or approved metal recycler.

The bridge structure is primarily composed of unpainted concrete. The only materials sampled for lead based paint were the metal bridge shoes, metal bridge bolts and plates, and the concrete bridge piers. The results of the XRF analyses indicate that the metal bridge shoes, metal bridge bolts and plates, and the concrete bridge piers were found to contain lead-based paint as summarized in Table 3 on the following page.

Sample Number	Material Description	Material Location	Color	Material Condition	LEAD Content mg/cm ²
Readings 102, 103, 104, 105	Metal Bridge Shoes	Left Side of Bridge	Grey	Intact	20.80 to 30.70
Readings 106, 107, 108, 109	Metal Bridge Bolts and Nuts	Left Side of Bridge	Grey	Intact	10.10 to 17.00
Readings 110, 111, 112	Concrete Bridge Piers	Left Side of Bridge	Yellow	Intact	2.20 to 2.60

Lead Content: EPA guidelines define lead-based paint as any paint with equal to or greater than 1.0 milligram of lead per square centimeter of painted surface (mg/cm²) when measured by X-ray Fluorescence. DHEC guidelines define lead-based paint as any paint with equal to or greater than 0.7 mg/cm² when measured by X-ray Fluorescence. The OSHA Lead in Construction Standard, 29 CFR 1926.62 is applied if any lead is present in the sample.

The results of these analyses indicate that the metal bridge shoes, metal bridge bolts and plates, and the concrete bridge piers were found to contain lead-based paint. The XRF data results are presented in Appendix D. Photographs of the site are located in Appendix F.

LEAD-BASED PAINT CONCLUSIONS / RECOMENDATIONS

A lead-based paint survey was performed for the US-29 (E. Cherokee St.) Bridge over I-85 at Exit 106 in Cherokee County, South Carolina. The results of the XRF analyses indicate that the metal bridge shoes, metal bridge bolts and plates, and the concrete bridge piers were found to be coated with lead-based paint. If these bridge components are disturbed during renovation or demolition, contractors and workers should be informed as to the presence of lead-based paint and appropriate work practices and personal protective equipment should be used to prevent exposure to lead dust/fumes or spreading lead contamination from the work site. The building components containing lead based paint should be disposed of in accordance with federal and state regulations. All waste debris coated with lead-based paint equal to or greater than 0.7mg/cm² must be disposed of in an approved Class II (C&D) or Class III (MSWLF) landfill or approved metal recycler. The OSHA lead standard for construction work (29CFR 1926.62) would apply to all demolition or renovation activities that disturb any of the materials containing lead.

In the event that any suspect painted materials were not addressed in this survey are encountered, the materials should be presumed to be coated with lead paint until XRF or laboratory analysis can be conducted.

EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Samples received in good condition unless otherwise noted. Estimated accuracy, precision and uncertainty data available upon request. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Reporting limit is 1%

APPENDIX E

SCDHEC Renovation and Demolition Guidelines

Q. Am I required to submit notification of all *renovation* projects?

A. Each owner/operator must notify DHEC's Asbestos Section in writing before beginning any renovation activity of a regulated facility/structure only if the scope of work contains asbestos. (see chart below)

Project Type	Minimum Required Notification Period
DEMOLITION	10 Working Days
NESHAP Removal (> or = 160 SF, 260 LF, or 35 CF)	10 Working Days
SMALL Removal (> 25 SF but < 160 SF, 260 LF, or 35 CF)	4 Working Days
MINOR Removal (< or = 25 SF)	2 Working Days
Non-Friable NESHAP- Sized Removal (non- friable > or = 160 SF, 260 LF, or 35 CF)	4 Working Days

Q. How do I notify DHEC's Asbestos Section?

A. Get notification forms by calling or writing to:

S.C. DHEC Asbestos Section 2600 Bull Street Columbia, SC 29201 (803) 898-4289

DHEC's Asbestos Section will mail you the necessary forms and can answer any questions you may have.

The forms and additional information are also available to view and download from the DHEC Asbestos Section's Web site at:

www.scdhec.gov/asbestos

This brochure is a brief overview of South Carolina's asbestos regulations pertaining to demolition and renovation activities. Before owners or operators become involved in demolition and renovation activities, they are encouraged to contact the DHEC-Asbestos Section to make sure they understand the applicable regulations, accreditation and permitting requirements.

South Carolina Department of Health and Environmental Control

Renovation, Demolition & Asbestos

What Building Owners & Contractors Should Know

S.C. Department of Health and Environmental Control

Asbestos Section 803-898-4289

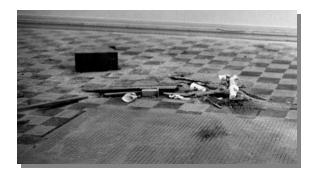

What is Asbestos?

Asbestos is the common name for a group of naturally occurring minerals made up of long, thin fibers. Asbestos is very strong and resistant to stress or forces that might tear it apart. It's also heat resistant. Asbestos fibers can be toxic to humans if inhaled. Despite this, it can still be found in a number of building products, including:

- Heating system insulation
- Spray-applied insulation
- Vinyl floor tiles
- Vinyl sheet flooring
- Ceiling tiles
- Roofing paper and shingles
- Cement siding shingles
- Plaster and joint compound

**It is still possible to purchase new products that contain asbestos. **

When materials that contain asbestos are disturbed during renovations or demolitions, people nearby may get the dangerous fibers in their lungs. So before beginning a building project that could disturb asbestos-containing materials, property owners need to know how to spot asbestos and ensure the safety of those working nearby.

Frequently Asked Questions

Q. What is demolition?

A. Demolition is the wrecking or removal of a regulated facility/structure's load-bearing structure(s). It also refers to related handling operations, the burning of a regulated facility, or moving of a regulated structure.

Q. What is renovation?

A. It's altering all or part of a regulated facility/ structure in any way (except demolition). Stripping or removing regulated asbestos-containing materials (RACM) from a regulated facility/structure is considered renovation.

Q. What is a regulated facility?

Δ

- Any institutional, commercial, public, industrial, or residential structure, installation, or building (including condominiums or individual dwelling units operated as a residential cooperative, but excluding residential buildings having four or fewer dwelling units);
- any bridge;
- any ship;
- any active or inactive waste disposal site; and

 any structure, installation or building that was previously subject to this requirement, regardless of its current use or function.

Note: Under this definition, any building, structure, or installation that contains a loft used as a dwelling is not considered a residential structure, installation, or building.

Q. Do asbestos regulations require me to have my property inspected for asbestos?

A. S.C. DHEC Regulation 61-86.1 states that prior to any demolition or renovation at a regulated facility, a thorough inspection must be done to detect any asbestos-containing materials. The inspection must be carried out by a person licensed by DHEC's Asbestos Section as an asbestos building inspector.

If asbestos is found in an area that will be disturbed during renovation or repair work, it must be removed properly and disposed of at an approved landfill. DHEC's Asbestos Section keeps a list of South Carolina landfills that accept asbestos. These actions also must occur prior to any building demolition project. In most cases, asbestos removal and disposal activities must be performed by a licensed asbestos abatement contractor.

Q. Am I required to submit notification of all demolition projects?

A. Each owner/operator must notify DHEC's Asbestos Section in writing before beginning any demolition of a regulated facility/structure regardless of the amount of asbestos present (and even when no asbestos is present).
