# 1 EXECUTIVE SUMMARY

This executive summary is intended as an overview for the convenience of the reader. This report should be reviewed in its entirety prior to making any decisions regarding this project. This investigation report is one of seven (7) completed for the project. The investigations included the existing north and southbound I-95 bridge structures, the former US 301/15 Trail Bridges, and the older remnants of the US 301 bridge. The below Bridge numbering system utilized for the investigations and referenced in this report reflects the numbering system developed by F&ME Consultants, Inc. (FME) field personnel during the field investigation and does not reflect any Bridge numbering system used by The South Carolina Department of Transportation (SCDOT). This report is specifically for the southbound I-95 Overflow Bridge only. Refer to other reports prepared by FME for the other bridges.

FME has completed the Asbestos Containing Material (ACM) Investigations of the existing southbound I-95 Bridge over Lake Marion Overflow (Bridge #1) in Clarendon and Orangeburg Counties in South Carolina, at the request of Transystems (Client). The field investigations were performed between July 19, 2023 and July 21, 2023, in anticipation of the off-alignment replacement of the existing I-95 bridges. This investigation was conducted pursuant to South Carolina Department of Health and Environmental Control (SCDHEC), United States Environmental Protection Agency (USEPA), National Emission Standards for Hazardous Air Pollutants (NESHAP), and Occupational Safety and Health Administration (OSHA) regulations requiring an ACM investigation prior to any demolition activities.

Per an agreed upon scope of work, FME performed this investigation to identify any ACM that might be encountered during the demolition of the existing Bridge, and to provide recommendations regarding proper handling and disposal of any ACM found. The investigation of the subject Bridge identified multiple suspect materials: expansion joint materials, bond break bearing pads, and expansion joint sealers. During the field investigation, FME collected samples of the suspect materials and assessed the physical condition of each material. **Laboratory results indicate that the materials sampled during this investigation were negative for asbestos.** During the demolition activities, previously concealed ACM may be discovered. If hidden suspect ACM is encountered not addressed in this report, the affected contractor(s) must stop work, take appropriate actions, and notify the Owner/FME for an appropriate response action.

We sincerely appreciate the opportunity to assist you with this project. Should you have any questions or require additional information concerning this Investigation, please do not hesitate to contact our office at (803) 254-4540.

Sincerely,

F&ME CONSULTANTS

## 2 INTRODUCTION

FME has completed an ACM investigation on the southbound I-95 over Lake Marion Overflow Bridge in Clarendon and Orangeburg Counties in South Carolina. The investigation was performed on July 19<sup>th</sup> through July 21<sup>st</sup>, 2023. This investigation was conducted pursuant to SCDHEC, USEPA, NESHAP, and OSHA regulations which require an ACM investigation prior to any demolition activities. Refer to Appendix A, Site Vicinity Map for the location of the Bridge.

It is our understanding that the existing Bridge will to be demolished, in anticipation of the off-alignment replacement of the existing I-95 Bridge. The scope of this investigation was to determine if asbestos was present on this Bridge by identifying and sampling suspect ACM, obtaining analytical results, quantifying any confirmed ACM, and assessing the physical condition of the ACM, where possible.

This report has been prepared exclusively for the Client and shall not be disseminated in whole or part to other parties without prior consent from the Client or FME. No other environmental issues were addressed as part of this report.

## 3 EXISTING BRIDGE STRUCTURE

The existing Bridge is located along I-95 and crosses over Lake Marion in Clarendon and Orangeburg Counties in South Carolina. The date of construction for the existing southbound I-95 Overflow Bridge (Bridge #4) over Lake Marion were constructed in the late 1960's to early 1970's based on the original construction drawings.

The southbound I-95 Lake Marion Overflow (Bridge #4) (~350.0' L x 31.0'W inside curb to inside curb) is two (2) lane, concrete and steel bridge structure with poured-in-place concrete bridge decking, concrete curb/gutter, and concrete guardrails along with metal scuppers.

The Bridge is constructed with a pre-cast prestressed beams and poured-in-place (PIP) diaphragms. The bentcaps were PIP concrete supported by driven hexagonal concrete piles.

*Photo 1 – Southbound I-95 over Lake Marion Overflow Bridge in Clarendon & Orangeburg Counties, SC.*

## 4 FIELD ASSESSMENT

During the inspection, all bridge components (i.e., concrete bent caps, piers, scuppers, and expansion joints) were visually inspected for suspect ACM. Examples of possible suspect materials include bent cap bearing materials, expansion joint materials and scuppers. The bridge deck rested directly on concrete bent caps with bond break bearing pads between them. The PIP concrete bent caps were supported by driven hexagonal concrete pipes. Bent cap bearing pads, expansion joint materials, and expansion joint sealers were noted during the investigation as suspect materials. Refer to Appendix B, Sample Location Plan, for detailed sample locations. Also, see Appendix F, Site Photographs, for more details.

## 5 RECOMMENDATIONS

The results, conclusions, and recommendations of this Investigation are representative of the conditions observed at the site on the date of the field investigation. FME does not assume responsibility for any changes in conditions or circumstances that may have occurred after this investigation.

It is our understanding that the existing Bridge will to be demolished, in anticipation of the off-alignment replacement of the existing I-95 Bridge. **Laboratory results indicate that the materials sampled during this investigation were negative for asbestos.** Therefore, there are no foreseen special handling or disposal requirements, regarding asbestos, that will be required for the demolition of this bridge.

If any concealed and/or inaccessible suspect ACM are encountered during the demolition activities, the affected contractor(s) must stop work, take appropriate actions, and notify the Owner/Asbestos Consultant for an appropriate response action. The SCDHEC must be notified if any suspect ACM is discovered.

This report has been prepared exclusively for the Client and FME and shall not be disseminated in whole or in part to other parties without prior consent from the Client. Use of this document for bidding purposes is not recommended without prior consultation with FME.

We sincerely appreciate the opportunity to be of service to Transystems in this matter. If you have any questions regarding the information presented herein, please contact our office at (803) 254-4540.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.
